Foundation Mathematics for Computer Science John Vince,2015-07-27 John Vince describes a range of mathematical topics to provide a foundation for an undergraduate course in computer science, starting with a review of number systems and their relevance to digital computers, and finishing with differential and integral calculus. Readers will find that the author's visual approach will greatly improve their understanding as to why certain mathematical structures exist, together with how they are used in real-world applications. Each chapter includes full-colour illustrations to clarify the mathematical descriptions, and in some cases, equations are also coloured to reveal vital algebraic patterns. The numerous worked examples will consolidate comprehension of abstract mathematical concepts. Foundation Mathematics for Computer Science covers number systems, algebra, logic, trigonometry, coordinate systems, determinants, vectors, matrices, geometric matrix transforms, differential and integral calculus, and reveals the names of the mathematicians behind such inventions. During this journey, John Vince touches upon more esoteric topics such as quaternions, octonions, Grassmann algebra, Barycentric coordinates, transfinite sets and prime numbers. Whether you intend to pursue a career in programming, scientific visualisation, systems design, or real-time computing, you should find the author's literary style refreshingly lucid and engaging, and prepare you for more advanced texts.

Forging Equipment, Materials, and Practices Taylan Altan,1973 The handbook provides design engineers with up-to-date information about the many aspects of forging including descriptions of important developments made more recently by industry and/or government. The handbook describes suitable measures for in-process quality control and quality assurance, summarizes relationships between forging practices and important mechanical properties and compares various forging devices to aid in equipment selection. Attention is also given to describing practices for relatively new materials and emerging forging practices. (Modified author abstract).

Babel und Bibel 6 Leonid E. Kogan, N. Koslova, S. Loesov, S. Tishchenko, 2011-12-25 This is the sixth volume of *Babel und Bibel*, an annual of ancient Near Eastern, Old Testament, and Semitic studies. The principal goal of the annual is to reveal the inherent relationship between Assyriology, Semitics, and biblical studies—a relationship that our predecessors comprehended and fruitfully explored but that is often neglected today. The title *Babel und Bibel* is intended to point to the possibility of fruitful collaboration among the three disciplines, in an effort to explore the various civilizations of the ancient Near East. The tripartite division of *Babel und Bibel* corresponds to its three principal spheres of interest: ancient Near Eastern, Old Testament, and Semitic studies. Contributions are further subdivided into articles, short notes, and reviews. Highlights of this volume include several studies on Akkadian language, Mesopotamian literature, and publication of inscriptions in some Russian museums (in the ancient Near Eastern section); studies

on negative markers in Semitic and on Aramaic language (in the Semitics section); and some significant review essays on important new publications, especially in Hebrew language, Aramaic, Hurrian, Lycian, Egyptian, and Syriac.
