Jack Cuzick, Mangesh A. Thorat

Prostate Cancer Prevention Jack Cuzick, Mangesh A. Thorat, 2014-02-15 Prostate cancer is by far the most common cancer in men and the second leading cause of death due to cancer. It comprises a mixed group of tumours displaying varying clinical behaviour: while some have a very aggressive course, others are rather indolent. Prevention of prostate cancer and discrimination between aggressive and indolent forms are important clinical goals and the acquisition of significant new evidence on means of achieving these aims makes this book particularly timely. A wide range of topics are covered by leading authorities in the field. The biology and natural history of prostate cancer are reviewed and the role of lifestyle and dietary factors, assessed. Detailed attention is paid to risk prediction biomarkers and to the role of novel high-throughput nucleic acid-based technologies in improving risk prediction and thereby allowing tailored approaches to cancer prevention. Potential means of chemoprevention of prostate cancer are also reviewed in depth, covering the very positive new data on the impact of aspirin as well as evidence regarding 5 α -reductase inhibitors, DFMO and lycopene. Guidance is provided on the differentiation of aggressive from indolent disease and the policy and research implications of recent findings are examined. This book will be of interest to both clinicians and researchers.

Prostate Cancer Screening Donna Pauler Ankerst, Catherine M. Tangen, Ian M. Thompson, 2009-01-24 More than one in six men will develop prostate cancer in their lifetime. In recent years there has been an explosion of information regarding PSA screening and biomarkers for the disease. In *Prostate Cancer Screening*, Second Edition,

the world's leading experts on prostate cancer detection update the first edition with the latest findings. The book incorporates a series of thoughtful and cutting-edge works from the world's experts in prostate cancer screening, ranging from the current status quo of prostate cancer screening across the globe to consensus on optimal utilization of the traditional PSA and DRE tests, to cutting-edge research in new biomarkers, biomeasures, and extended risk algorithms for prostate cancer. An additional chapter covers family-based linkage analysis as well as possible pitfalls in prostate cancer biomarker evaluation studies. Timely and authoritative, Prostate Cancer Screening, Second Edition, is an essential text for urologists, oncologists and family physicians, as well as researchers in the biomarker industry who seek methods to better develop and support markers and measures of prostate cancer.

Men at Risk Ronald E. Wheeler, 2012-04-19 Dr. Ronald E. Wheeler is unique in the medical world and the practice of Urology. Dr. Wheeler is one of the world's leading diagnostic and treating Prostate Cancer Specialists based upon a very sophisticated skill set. Dr. Wheeler diagnoses and treats only prostate disease in a full time clinical practice in Sarasota, Florida. Less than a handful of Urologists from around the world can make claim to specializing in prostate related issues only. Dr. Wheeler's clinical expertise in the diagnosis and treatment of prostate cancer has superseded the credentialing process. In fact, Dr. Wheeler intends to establish credentialing guidelines for physicians relevant to prostate specific diagnostic and treatment modalities. Dr. Wheeler is a world expert in High Intensity Focused Ultrasound (HIFU), having diagnosed and treated more patients for prostate cancer from more countries than any other treating doctor in the world. HIFU

worldwide is a viable treatment option for prostate cancer, benign prostatic hyperplasia (BPH) and Uterine fibroids in women. Dr. Wheeler is arguable the worlds most acclaimed Urologist in the application of prostate imaging through ultrasound and 3.0 Tesla Magnetic Resonance Imaging (with or without spectroscopy) while improving excellence in outcome data compared to doctors who rely on random ultrasound guided biopsies as a questionable standard care. The fact that 40-60% of men fail to be cured from prostate cancer by 7-10 years following radiation or radical prostatectomy (including the Da Vince robot) speaks to the inability of ultrasound to identify cancer accurately and further supports the need for other Urologists to follow the path Dr. Wheeler has chosen. Beyond this, Dr. Wheeler is the Medical Director for a Tampa, Florida based company that has developed an oncolytic virus that expects to alter the landscape of some of the most unpredictable diseases men and woman face including prostate and breast cancer. Because of Dr. Wheelers passion and expertise, patients seek his leadership in disease assessment from all over the world!

Evaluation of a Culturally Targeted, Personalized Mail-Home Brochure Directed to Partners of At-Risk Men to Facilitate Prostate Cancer Risk Assessment ,2006 Prostate cancer is the second leading cause of cancer death in men. Like other forms, prostate cancer exists in both sporadic and hereditary forms. A family history of prostate cancer and African-American ethnicity are two key factors that have been found to place men at increased risk for developing the disease. However, at-risk men exhibit low levels of prostate cancer risk-related knowledge, despite their increased risk as a group. Prostate cancer risk assessment provides an opportunity to weigh available information and make decisions about screening options; it also provides a window of opportunity to offer

concrete instruction in specific prevention behaviors. While there is controversy over the benefits and liabilities associated with prostate cancer screening, there is agreement that at-risk men need to understand the issues related to prostate cancer risk management. Family members can help facilitate health-related behavior and may serve as an important, but underutilized, gateway into the health care system. Thus, guided by the Cognitive-Social Health Information Processing (C-SHIP) model, the current study will evaluate the impact of a communication message intervention tailored to the partners of at-risk men enrolling in prostate cancer risk assessment to facilitate screening adherence.

UNDERSTANDING PROSTATE CANCER THADEUS. MATEMBA,2020

Multigene Panels in Prostate Cancer Risk Assessment U. S. Department of Health and Human Services, Agency for Healthcare Research and Quality, 2013-03-22 Prostate cancer is the fifth most common malignancy in the world, with a large variation in incidence rates. In 2010, it was estimated that almost a quarter of a million new cases were diagnosed in North America, and more than 36,000 men died from the disease. Apart from age, ethnic group, and family history, the risk factors associated with prostate cancer are unclear, making primary prevention difficult. Striking differences in incidence have been observed for different ethnic groups and populations. A high incidence has been observed in populations of African descent in several countries. First-degree relatives of men with prostate cancer have a two- to threefold increased risk for developing the disease, and its estimated heritability is high. Some patterns of familial aggregation have been observed that are consistent with an autosomal dominant mode of inheritance of a susceptibility gene, but this accounts for no more than 15 percent of cases. Prostate cancer is currently

considered to be a complex, multifactorial disease with the vast majority of familial clustering attributed to the interaction of multiple shared moderate to low penetrance susceptibility genes and shared environmental factors within these families. Many epidemiological studies have suggested a wide range of other risk factors for prostate cancer, but these have not been confirmed in controlled trials. The natural history of prostate cancer is highly variable. In a large proportion of men, the disease is indolent, and it is difficult to predict which tumors will be aggressive. African-American men have a poorer prognosis than other groups, independent of comorbidity or access to health services. The value of aggressive management for localized prostate cancer is also debated, and only a small proportion of men with early stage prostate cancer die from the disease within 10 to 15 years of diagnosis. Prostate-specific antigen (PSA) was approved by the U.S. Food and Drug Administration in 1986 for monitoring progression in patients with prostate cancer, and later approved for the detection of the disease in symptomatic men (but not for screening asymptomatic men). A meta-analysis of seven randomized controlled trials of screening using PSA testing alone, or in combination with digital rectal examination, suggested no evidence of benefit in reducing mortality, and some evidence of harms from overdiagnosis. Amidst substantial debate, the argument has been made for developing more accurate screening tests, including possible genetic markers. Single nucleotide polymorphisms (SNPs) are minute inherited variations in the DNA sequence. SNPs occur about once in every 800 base pairs and are the most common type of genetic variation in humans. Since 2001, there have been about 1,000 published studies reporting associations between prostate cancer, SNPs, and other genetic variants. To date, genome-

wide association (GWA) studies have identified replicated associations between prostate cancer and almost 40 specific SNPs. The aim of this review is to assess the evidence on the possible value of SNP panels in the detection of and prediction of risk for prostate cancer, and their value in predicting disease prognosis in affected men. This report addresses the evidence on the validity and utility of using SNP panels in the detection, diagnosis, and clinical management of prostate cancer. The specific Key Questions are: 1. What is the analytic validity of currently available SNP-based panels designed for prostate cancer risk assessment? 2. What is the clinical validity of currently available SNP-based panels designed for prostate cancer risk assessment? 3. What is the clinical utility of currently available SNP-based panels for prostate cancer risk assessment, in terms of the process of care, health outcomes, harms, and economic considerations?

Prostate Cancer Jack H. Mydlo, Ciril J. Godec, 2015-09-29 Prostate Cancer, Science and Clinical Practice, Second Edition, continues to be an important translational reference that bridges the gap between science and clinical medicine. It reviews the biological processes that can be implicated in the disease, reviews current treatments, highlights the pitfalls where relevant, and examines the scientific developments that might result in future treatments. Key chapters from the previous edition have been updated, and a plethora of new chapters describe new concepts of prostate cancer biology and newly developed therapeutics. Each chapter has been written by internationally recognized specialists on prostate cancer epidemiology, genetic susceptibility, cancer metastases, prostate physiology, proteomics, new therapeutics, and clinical trials. Presents a comprehensive, translational source for all aspects of prostate cancer in one reference work Provides a

common language for cancer researchers, oncologists, and urologists to discuss prostate tumors and how prostate cancer metastases affects other major organ systems Offers insights to research clinicians, giving them a key understanding the molecular basis of prostate cancer Offers insights to cancer researchers into how clinical observations and practices can feed back into the research cycle and, therefore, can contribute to the development of more targeted genomic and proteomic assays

Management of Prostate Cancer Michel Bolla,Hendrik van Poppel,2017-01-09 This book, now in an extensively revised second edition, provides an exhaustive review of the state of the art in the management of prostate cancer, from screening to treatment, with emphasis on a multidisciplinary approach. The editors are very excited about the outstanding new or updated contributions from the different expert authors. The opening chapters address basic aspects including epidemiology, pathology, biology, genetics, and chemoprevention. The role of individual and mass screening is carefully appraised, and extensive attention is devoted to diagnosis and clinical work-up by means of recently implemented investigations such as multiparametric MRI and choline PET-CT. The use of active surveillance is examined in detail. Subsequent chapters discuss the different therapies that may be employed: open and minimally invasive, including robot-assisted, radical prostatectomy, the various forms of radiation treatment, high-intensity focused ultrasound, cryotherapy, hormonal manipulations, chemotherapy, targeted therapies, and immunotherapy. Up-to-date results from practice-changing phase III randomized clinical trials are included and special insights are provided into the interpretation of results and the patient's perspective.

Early Detection of Prostate Cancer, An Issue of Urologic Clinics, Stacy Loeb, 2014-04-16 PSA screening remains highly controversial due to several important disadvantages. More PSA is produced with prostatic enlargement and in other benign conditions such as urinary tract infections. False positive tests can then lead to unnecessary diagnostic workup with invasive prostate biopsy. Another major problem with screening programs in general is overdiagnosis of cancers that would not have caused

harm during the patient's lifetime. For example, many prostate cancers have a relatively indolent behavior so may not require diagnosis or treatment in a patient with limited life expectancy. All forms of prostate cancer treatment have potential urinary and sexual side effects, so reducing overdiagnosis and overtreatment are critical public health issues. Because screening has many proven benefits but also significant harms, there are widely disparate guidelines on prostate cancer screening from major organizations worldwide. This issue of the Urologic Clinics will provide insights into the many different prostate cancer guidelines and related policy issues.
