Travels with Curiosity Charles J. Byrne,2020-09-28 The Mars Curiosity Rover is the most sophisticated mobile laboratory ever deployed on a planet. For over seven years, scores of investigators have planned its daily route and activities, poring over the overwhelming images and data and revising our understanding of planetary surfaces, geology, and potential habitability. This book takes readers right down to the surface of Mars, chronicling Curiosity's physical and scientific journey across the planet's Earth-like, yet strikingly alien vistas. Through dozens of images and descriptive accounts of the surface, you will gain a deeper knowledge of the Martian landscape, from the floor of Gale Crater up to the cliffs of Mount Sharp. Presented at the end of each chapter are the results and revelations from the science team spearheading the mission. Like any cross-country road trip, the rover has hit some unexpected hitches along the way. The book describes the obstacles faced by the rover and its scientists over the years and the difficult decisions and careful experimentation it took to solve them.

Mobile Robots in Rough Terrain Karl Iagnemma,Steven Dubowsky,2004-07-08 This monograph discusses issues related to estimation, control, and motion planning for mobile robots operating in rough terrain, with particular attention to planetary exploration rovers. Rough terrain robotics is becoming increasingly important in space exploration, and industrial applications. However, most current motion planning and control algorithms are not well suited to rough terrain mobility, since they do not consider the physical characteristics of the rover and its environment. Specific addressed topics are: wheel terrain interaction modeling, including terrain parameter estimation and wheel terrain contact angle estimation; rough terrain motion planning; articulated suspension control; and traction control. Simulation and experimental results are presented that show that the described algorithms lead to improved mobility for robotic systems in rough terrain.

Planetary Rovers Lutz Richter,2019-09-11 The book opens with an introduction to the use of robotic rovers for planetary exploration and their relationship to other terrestrial applications, including oceanography. The terrain in particular, in planetary environment, is a major design driver for the planetary rover and therefore a review of each planet and small bodies of the solar system and their impact on rover design is provided. Mars is the best known example for the NASA 'follow the water' strategy in astrobiology research and is the most likely planet to be explored in the near term. Planetary missions are designed with a different engineering philosophy than Earth-orbiting missions. There are great uncertainties about the operational environment, new scientific instruments, and the requirement for new spacecraft and robotic technologies to make them economically feasible. These include rover design, locomotion, autonomous navigation, rover avionics, mission communications' architecture and power generation and thermal control. The authors conclude by speculating on the need for the manned astrobiological investigation of Mars in terms of near-term evolution of robotic terminology and how robotic rovers can support manned mission by relieving the astronaut/cosmonaut workload. In addition, the future of robotic astrobiology missions will be explored with the implementation of biomimetic robots which attempt to utilise biological solutions to engineering problems. Finally, Nanotechnology and its limitations in the miniaturisation of actuation systems will be covered.

Data Management for Mobile Computing Evaggelia Pitoura,George Samaras,2012-12-06 Earth date, August 11, 1997 Beam me up Scottie! We cannot do it! This is not Star Trek's Enterprise. This is early years Earth. True, this is not yet the era of Star Trek, we cannot beam captain James T. Kirk or captain Jean Luc Picard or an apple or anything else anywhere. What we can do though is beam information about Kirk or Picard or an apple or an insurance agent. We can beam a record of a patient, the status of an engine, a weather report. We can beam this information anywhere, to mobile workers, to field engineers, to a track loading apples, to ships crossing the Oceans, to web surfers. We have reached a point where the promise of information access anywhere and anytime is close to realization. The enabling technology, wireless networks, exists; what remains to be achieved is providing the infrastructure and the software to support the promise. Universal access and management of information has been one of the driving forces in the evolution of computer technology. Central computing gave the ability to perform large and complex computations and advanced information manipulation. Advances in networking connected computers together and led to distributed computing. Web technology and the Internet went even further to provide hyper-linked information access and global computing. However, restricting access stations to physical location limits the boundary of the vision.

Range Rover Second Generation James Taylor,2018-09-23 The second generation Range Rover was arguably Land Rover's first model designed as a luxury vehicle. It was a major leap for the company, but a very successful one as well. Despite controversy over its looks, and some initial teething problems, it became a worthy successor to the much-loved original. Range Rover Second Generation The Complete Story draws on the memories of designers and engineers as well as on a wide variety of factory sources to provide the most authoritative history of the mode yet. The book covers the full development history; the changes during eight years of production; Range Rovers for the North American market; full technical specifications and finally Range Rovers and the emergency services.A companion volume to the author's Range Rover First Generation - The Complete Story (Crowood 2018).

Bilateral Teleoperation of a Planetary Rover with Time Delays Zhihao Xu,2009-08 This thesis work addresses the bilateral teleoperation of a planetary rover, named MERLIN (Mobile Experimental Robot for Localization and Intelligent Navigation). The teleoperation platform is built up between the rover and a haptic device. The

haptic device provides a force-feedback mechanism, which describes the environmental conditions regarding the obstacles, based on the ranging information from the rover. Therefore, obstacle avoidance can be achieved independent of the visualization of the environment, which, on the other hand, will reduce the communication burden. This can be highly desirable in low-light conditions and in remote teleoperation cases, in which difficulties may arise in visualizing the surroundings. Communication delay is the main concern in this thesis work, because it will result in poor performance of the overall system and even lead to instability of the closed-loop teleoperation. The technology developed in this thesis work will improve the quality of navigating MERLIN rovers. and provide basics for teleoperation of multiple mobile robots, as well as robotic maneuvers by means of mobile manipulators.
