Services in Wireless Sensor Networks Markus Becker,2014-03-27 In recent years, originally static and single purpose Wireless Sensor Networks have moved towards applications that need support for mobility and multiple purposes. These heterogeneous applications and services demand for a framework which distributes and discovers the various services, so that other pieces of equipment can use them. Markus Becker studies, extends, analytically models, simulates and employs the so called Trickle algorithm in measurements in a Wireless Sensor Network test bed for the service distribution. The obtained results apply to the application of the Trickle algorithm at lower protocol layers, e.g. for routing, as well. Given application delay requirements, the author derives the realizable distances and number of nodes for two network topologies from the 95 percentiles obtained by simulation.

Symbolizing Existence Ludger Hovestadt, Vera Bühlmann, 2016-05-24 Symbolizing Existence deals with the current rapidly happening “deterritorialization” of everything which was once regarded stable and binding. What we today regard as statistically encoded information is capable to explicate and index the entire realm of what can be expressed and represented through a cascade of geometrical, functional, or finally logified schemes. We are currently experiencing a rapid loss of “grounding” of that which we once considered binding in our cultural and intellectual history. How can we obtain an articulate, cultivate way of thinking about “instances” that does not fall back into a schematic model Platonism (thereby falling behind Plato), and that does not remain enmeshed in an Aristotelian realization dynamics with a naturalism organized by original genus, kinds, and specific marks of distinction? The central phenomenon considered was the technological process of doping material: At the quantum level, a particle or its representation, the point, is no longer “that which has no parts” (Euclid).
