Making Sense of Recordings Mads Walther-Hansen,2020 Building on ideas from cognitive metaphor theory, Making Sense of Recordings offers a new perspective on record production, music perception, and the aesthetics of recorded sound. It shows how the language about sound is intimately connected to sense-making - both as a reflection of our internal cognitive capacities and as a component of our extended cognitive system. In doing so, the book provides the foundation for a broader understanding of the history of listening, discourses of sound quality, and artistic practices in the age of recorded music. The theoretical and historical foundations are presented in the first part of the book and they are followed by discussions of specific sound quality descriptors in an expanded Encyclopedia of sound-describing terms. The book will be of interest to anyone who asks how recorded music sounds and why it sounds as it does, and it will be a valuable resource

for musicology students and researchers interested in the analysis of sound and the history of listening and record production. Additionally, sound engineers and laptop musicians will benefit from the book's exploration of the connection between embodied experiences and our cognitively processed experiences of recorded sound. The tools provided will be useful to these and other musicians who wish to intuitively interact with recorded or synthesized sound in a manner that more closely resembles the way they think and that makes sense of what they do.

Non-Stoichiometry in Semiconductors K.J. Bachmann,H.-L. Hwang,C.

Schwab,2012-12-02 Significant advances have occurred in the theory of non-stoichiometry problems and fundamentally new and wide-ranging applications have been developed, helping to better identify relevant issues. The contributions in this volume bring together the experience of specialists from different disciplines (materials scientists, physicists, chemists and device people) confronted with non-stoichiometry problems. The 40 papers, including 9 invited papers, give an advanced scenario of this wide interdisciplinary area, which is highly important in its diverse aspects of theory, implementation and applications. This work will be of interest not only to universities and laboratories engaged in studies and research in this field, but also to organizations and industrial centres concerned with implementations and applications. The diversity of the topics, as well as the extraordinary tempo in which Non-stoichiometry in Semiconductors has progressed in recent years attest

to the permanent vitality of this field of research and development.

The Topos of Music IV: Roots Guerino Mazzola, 2018-03-29 This is the fourth volume of the second edition of the now classic book "The Topos of Music". The author presents appendices with background material on sound and auditory physiology; mathematical basics such as sets, relations, transformations, algebraic geometry, and categories; complements in physics, including a discussion on string theory; and tables with chord classes and modulation steps.

Modeling the Radiation of Modern Sound Reinforcement Systems in High Resolution Stefan Feistel, 2014-06-04 Starting from physical theory, this work develops a novel framework for the acoustic simulation of sound radiation by loudspeakers and sound reinforcement systems. First, a theoretical foundation is derived for the accurate description of simple and multi-way loudspeakers using an advanced point-source "CDPS" model that incorporates phase data. The model's practical implementation is presented including measurement requirements and the GLL loudspeaker data format specification. In the second part, larger systems are analyzed such as line arrays where the receiver may be located in the near field of the source. It is shown that any extended line source can be modeled accurately after decomposition into smaller CDPS elements. The influence of production variation among elements of an array is investigated and shown to be small. The last part of this work deals with the consequences of fluctuating environmental conditions such as wind and temperature on the coherence of sound signals from multiple sources. A new theoretical model is developed that allows predicting the smooth transition from amplitude to power summation as a function of the statistical properties of the

environmental parameters. A part of this work was distinguished with the AES Publications Award 2010. Parts of the proposed data format have been incorporated into the international AES56 standard.

Film Music in the Sound Era Jonathan Rhodes Lee, 2020-03-10 Film Music in the Sound Era: A Research and Information Guide offers a comprehensive bibliography of scholarship on music in sound film (1927–2017). Thematically organized sections cover historical studies, studies of musicians and filmmakers, genre studies, theory and aesthetics, and other key aspects of film music studies. Broad coverage of works from around the globe, paired with robust indexes and thorough cross-referencing, make this research guide an invaluable tool for all scholars and students investigating the intersection of music and film. This guide is published in two volumes: Volume 1: Histories, Theories, and Genres covers overviews, historical surveys, theory and criticism, studies of film genres, and case studies of individual films. Volume 2: People, Cultures, and Contexts covers individual people, social and cultural studies, studies of musical genre, pedagogy, and the industry. A complete index is included in each volume.

A Small Sound of the Trumpet Margaret Wade LaBarge, 1986 Describes the daily life of noblewomen, nuns, and peasants in feudal England and Europe, looks at the treatment of lepers, beggars, prostitutes, and criminals, and offers brief profiles of prominent medieval women.

Photoelastic and Electro-Optic Properties of Crystals T. S. Narasimhamurthy, 2012-12-06 This comprehensive treatise reviews, for the first time, all the essential work over the past 160 years on the photoelastic and the closely related linear and quadratic electro-optic

effects in isotropic and crystalline materials. Emphasis is placed on the phenomenal growth of the subject during the past decade and a half with the advent of the laser, with the use of high-frequency acousto-optic and electro-optic techniques, and with the discovery of new piezoelectric materials, all of which have offered a feedback to the wide interest in these two areas of solid-state physics. The first of these subjects, the photoelastic effect, was discovered by Sir David Brewster in 1815. He first found the effect in gels and subsequently found it in glasses and crystals. While the effect remained of academic interest for nearly a hundred years, it became of practical value when Coker and Filon applied it to measuring stresses in machine parts. With one photograph and subsequent analysis, the stress in any planar model can be determined. By taking sections of a three-dimensional model, complete three-dimensional stresses can be found. Hence this effect is widely applied in industry.
