The Moduli Space of Curves Robert H. Dijkgraaf,Carel Faber,Gerard B.M. van der Geer,2012-12-06 The moduli space Mg of curves of fixed genus g — that is, the algebraic variety that parametrizes all curves of genus g — is one of the most intriguing objects of study in algebraic geometry these days. Its appeal results not only from its beautiful mathematical structure but also from recent developments in theoretical physics, in particular in conformal field theory.

Space-Filling Curves Hans Sagan,2012-12-06 The subject of space-filling curves has fascinated mathematicians for over a century and has intrigued many generations of students of mathematics. Working in this area is like skating on the edge of reason. Unfortunately, no comprehensive treatment has ever been attempted other than the gallant effort by W. Sierpiriski in 1912. At that time, the subject was still in its infancy and the most interesting and perplexing results were still to come. Besides, Sierpiriski's paper was written in Polish and published in a journal that is not readily accessible (Sierpiriski [2]). Most of the early literature on the subject is in French, German, and Polish, providing an additional raison d'etre for a comprehensive treatment in English. While there was, understandably, some intensive research activity on this subject around the turn of the century, contributions have, nevertheless, continued up to the present and there is no end in sight, indicating that the subject is still very much alive. The

recent interest in fractals has refocused interest on space filling curves, and the study of fractals has thrown some new light on this small but venerable part of mathematics. This monograph is neither a textbook nor an encyclopedic treatment of the subject nor a historical account, but it is a little of each. While it may lend structure to a seminar or pro-seminar, or be useful as a supplement in a course on topology or mathematical analysis, it is primarily intended for self-study by the aficionados of classical analysis.

  <u>Introduction to Differential Geometry of Space Curves and Surfaces</u> Taha Sochi,2022-09-14 This book is about differential geometry of space curves and surfaces. The formulation and presentation are largely based on a tensor calculus approach. It can be used as part of a course on tensor calculus as well as a textbook or a reference for an intermediate-level course on differential geometry of curves and surfaces. The book is furnished with an index, extensive sets of exercises and many cross references, which are hyperlinked for the ebook users, to facilitate linking related concepts and sections. The book also contains a considerable number of 2D and 3D graphic illustrations to help the readers and users to visualize the ideas and understand the abstract concepts. We also provided an introductory chapter where the main concepts and techniques needed to understand the offered materials of differential geometry are outlined to make the book fairly self-contained and reduce the need for external references.

Solutions of Exercises of Introduction to Differential Geometry of Space Curves and Surfaces Taha Sochi,2022-10-13 This book contains the solutions of the exercises of my book: Introduction to Differential Geometry of Space Curves and Surfaces. These solutions are sufficiently simplified and detailed for the benefit of readers of all levels particularly those at introductory level.

Space-Filling Curves Michael Bader,2012-10-14 Linking the differing techniques deployed in describing space-filling curves to their corresponding algorithms, this book introduces SFCs as tools in scientific computing, focusing in particular on the representation of SFCs and on the resulting algorithms.

Space Curves Franco Ghione,Christian Peskine,Edoardo Sernesi,1987-07-15 The main topics of the conference on Curves in Projective Space were good and bad families of projective curves, postulation of projective space curves and classical problems in enumerative geometry.

Differential Geometry of Curves and Surfaces Shoshichi Kobayashi,2019-11-13 This book is a posthumous publication of a classic by Prof. Shoshichi Kobayashi, who taught at U.C. Berkeley for 50 years, recently translated by Eriko Shinozaki Nagumo and Makiko Sumi Tanaka. There are five chapters: 1. Plane Curves and Space Curves; 2. Local Theory of Surfaces in Space; 3. Geometry of Surfaces; 4. Gauss–Bonnet Theorem; and 5. Minimal Surfaces. Chapter 1 discusses local and global properties of planar curves and curves in space. Chapter 2 deals with local properties of surfaces in 3-dimensional Euclidean space. Two types of curvatures – the Gaussian curvature K and the mean curvature H –are introduced. The method of the moving frames, a standard technique in differential geometry, is introduced in the context of a surface in 3-dimensional Euclidean space. In Chapter 3, the Riemannian metric on a surface is introduced and properties determined only by the first fundamental form are discussed. The concept of a geodesic introduced in Chapter 2 is extensively discussed, and several examples of geodesics are presented with illustrations. Chapter 4 starts with a simple and elegant proof of Stokes' theorem for a domain. Then the Gauss–Bonnet theorem, the major topic of this book, is discussed at great length. The theorem is a most beautiful and deep result in differential geometry. It yields a relation between the integral of the Gaussian curvature over a given oriented closed surface S and the

topology of S in terms of its Euler number χ(S). Here again, many illustrations are provided to facilitate the reader's understanding. Chapter 5, Minimal Surfaces, requires some elementary knowledge of complex analysis. However, the author retained the introductory nature of this book and focused on detailed explanations of the examples of minimal surfaces given in Chapter 2.

Pythagorean-Hodograph Curves: Algebra and Geometry Inseparable Rida T Farouki,2008-02-01 By virtue of their special algebraic structures, Pythagorean-hodograph (PH) curves offer unique advantages for computer-aided design and manufacturing, robotics, motion control, path planning, computer graphics, animation, and related fields. This book offers a comprehensive and self-contained treatment of the mathematical theory of PH curves, including algorithms for their construction and examples of their practical applications. It emphasizes the interplay of ideas from algebra and geometry and their historical origins and includes many figures, worked examples, and detailed algorithm descriptions.

Handbook and Atlas of Curves Eugene V. Shikin,2014-07-22 The Handbook and Atlas of Curves describes available analytic and visual properties of plane and spatial curves. Information is presented in a unique format, with one half of the book detailing investigation tools and the other devoted to the Atlas of Plane Curves. Main definitions, formulas, and facts from curve theory (plane and spatial) are discussed.

Lectures on Equations Defining Space Curves L. Szpiro,1979 THESE NOTES ARE the outcome of a aeries of lectures I gave in the winter of 1975-'76 at the Tata Institute of Fundamental Research, Bombay. The object of the research, we -D. FERRAND, L. GRUSON, C. PESKINE and I -started in Paris was, roughly speaking to find out the equations defining a -curve in projective 3-sp8ce (or in affine 3-space or of varieties of codimension two in projective n-space.) I took the opportunity given to me by the Mathematics Department of T. I. F. R, .to try to put coherently the progress. made by the four of us since our paper (11 J. Even though we are scattered over the earth now, (RENNE S, LILLE, OSLO and BOMBAY!) these notes should be considered as the result of common of all of us. I have tried in the quick description of the chapters to obey the Redde Caesari quae sunt Caesaris. Chapter I contains certain prerequisi.tes like duality, depth, divisors etc. and the following two interesting facts: i) An example of a reduced curve in p3 with no imbedded smooth deformation (an improvement on the counter example 6.4 in (11 J which was shown to me by G. Ellingrud from Oslo who also informed me that it can be found in M. Noether [10J). ti) A proof that every locally complete intersection curve in p3 can be defined by four equations, Chapter II is my personal version of the theory of condu'ctor for a curve.

On Pseudospherical Smarandache Curves in Minkowski 3-Space Esra Betul Koc Ozturk, Ufuk Ozturk, Kazim Ilarslan,Emilija Nešovi, In this paper we define nonnull and nullpseudospherical Smarandache curves according to the Sabban

frame of a spacelike curve lying on pseudosphere in Minkowski 3-space.

  Points and Curves in the Monster Tower Richard Montgomery,Mikhail Zhitomirski_,2010-01-15 Cartan introduced the method of prolongation which can be applied either to manifolds with distributions (Pfaffian systems) or integral curves to these distributions. Repeated application of prolongation to the plane endowed with its tangent bundle yields the Monster tower, a sequence of manifolds, each a circle bundle over the previous one, each endowed with a rank 2 distribution. In an earlier paper (2001), the authors proved that the problem of classifying points in the Monster tower up to symmetry is the same as the problem of classifying Goursat distribution flags up to local diffeomorphism. The first level of the Monster tower is a three-dimensional contact manifold and its integral curves are Legendrian curves. The philosophy driving the current work is that all questions regarding the Monster tower (and hence regarding Goursat distribution germs) can be reduced to problems regarding Legendrian curve singularities.

  Modeling of Curves and Surfaces with MATLAB® Vladimir Rovenski,2010-06-10 This text on geometry is devoted to various central geometrical topics including: graphs of functions, transformations, (non-)Euclidean geometries, curves and surfaces as well as their applications in a variety of disciplines. This book presents elementary methods for analytical modeling and demonstrates the potential for symbolic computational tools to support the development of analytical solutions. The author systematically examines

several powerful tools of MATLAB® including 2D and 3D animation of geometric images with shadows and colors and transformations using matrices. With over 150 stimulating exercises and problems, this text integrates traditional differential and non-Euclidean geometries with more current computer systems in a practical and user-friendly format. This text is an excellent classroom resource or self-study reference for undergraduate students in a variety of disciplines.

Polygonal Approximation and Scale-Space Analysis of Closed Digital Curves Kumar S. Ray,Bimal Kumar Ray,2013-02-19 This book covers the most important topics in the area of pattern recognition, object recognition, computer vision, robot vision, medical computing, computational geometry, and bioinformatics systems. Students and researchers will find a comprehensive treatment of polygonal approximation and its real life applications. The book not only explains the theoretical aspects but also presents applications with detailed design parameters. The systematic development of the concept of polygonal approximation of digital curves and its scale-space analysis are useful and attractive to scholars in many fields. Development for different algorithms of polygonal approximation and scale-space analysis and several experimental results with comparative study for measuring the performance of the algorithms are extremely useful for theoretical- and application-oriented works in the above-mentioned areas.
