Minimum Design Loads for Buildings and Other Structures

American Society of Civil Engineers, 1994 ASCE standard, Minimum Design Loads for Buildings and Other Structures, (ASCE 7-93 a revision of ANSI/ASCE 7-88), gives requirements for dead, live, soil, wind, snow, rain, and earthquake loads, and their combinations, that are suitable for inclusion in building codes and other documents. The major revision of this standard involves the section on earthquake loads. This section has been greatly expanded to include the latest information in the field of earthquake engineering. Based on this information criteria for the design and construction of buildings and similar structures subject to earthquake ground motions are presented. The basis of the requirement is described in the Commentary. The structural load requirements provided by this standard are intended for use by architects, structural engineers, and those engaged in preparing and administering local building codes.

Construction Engineering Design Calculations and Rules of Thumb Ruwan Abey Rajapakse, 2016-09-02 Construction Engineering Calculations and Rules of Thumb begins with a brief, but rigorous, introduction to the mathematics behind the equations that is followed by self-contained chapters concerning applications for all aspects of construction engineering. Design examples with step-by-step solutions, along with a generous amount of tables, schematics, and calculations are provided to facilitate more accurate solutions through all phases of a project, from planning, through construction and completion. Includes easy-to-read and understand tables, schematics, and calculations Presents examples with step-by-step calculations in both US and SI metric units Provides users with an illustrated, easy-to-understand approach to equations and calculation methods

Construction Calculations Manual Sidney M Levy, 2011-09-19

Construction Calculations is a manual that provides end users with

a comprehensive guide for many of the formulas, mathematical vectors and conversion factors that are commonly encountered during the design and construction stages of a construction project. It offers readers detailed calculations, applications and examples needed in site work, cost estimation, piping and pipefitting, and project management. The book also serves as a refresher course for some of the formulas and concepts of geometry and trigonometry. The book is divided into sections that present the common components of construction. The first section of the books starts with a refresher discussion of unit and systems measurement; its origin and evolution; the standards of length, mass and capacity; terminology and tables; and notes of metric, U.S, and British units of measurements. The following concepts are presented and discussed throughout the book: Conversion tables and formulas, including the Metric Conversion Law and conversion factors for builders and design professionals Calculations and formulas of geometry, trigonometry and physics in construction Rudiments of excavation, classification, use of material, measurement and payment Soil classification and morphology, including its physicochemical properties Formulas and calculations needed for soil tests and evaluations and for the design of retaining structures Calculations relating to concrete and masonry Calculations of the size/weight of structural steel and other metals Mechanical properties of wood and processing of wood products Calculations relating to sound and thermal transmission Interior finishes, plumbing and HVAC calculations Electrical formulas and calculations Construction managers and engineers, architects, contractors, and beginners in engineering, architecture, and construction will find this practical guide useful for managing all aspects of construction. Work in and convert between building dimensions, including metric Built-in right-angle solutions Areas, volumes, square-ups Complete stair layouts Roof, rafter and framing solutions Circle: arcs, circumference, segments

HomeSkills: Building Decks Editors of Cool Springs

Press,2013-08-01 DIVAs part of our comprehensive HomeSkills DIY series, HomeSkills: Building Decks takes the fear out of adding the perfect outdoor element to your house./divDIV/divDIVThereâ€™s a reason that deck building is the most popular do-it-yourself home improvement undertaking today: not only are decks an attractive, customizable component of classic American construction, they also allow for entertainment and relaxation in a way that indoor spaces simply canâ€™t. So if your house is already in top working order, and your lawn is looking mighty green this year, chances are thereâ€™s only one thing missingâ€”a deck. Fortunately, with all the innovative new products and materials coming onto the market, decks are easier to self-design and build than ever before. As it turns out, youâ€™re only one how-to book away from creating the deck of your dreams. In HomeSkills: Building Decks, the expert editors of Cool Springs Press join forces to cover every aspect of deck building, providing streamlined project descriptions with crystal-clear photos that leave no room for guesswork. Youâ€™ll learn how to plan and design, then select materials, dig postholes, hang joists, and install the decking itself. We even cover stairs, railings, overheads, and extra accessories like screens and arbors. With 300 illustrations and 10 supplementary diagrams, one thorough book prevents two things from collapsing: you and your shiny new deck. And thatâ€™s good for all of us./divDIV/divDIVCheck out our five other HomeSkills guides on carpentry, landscaping, plumbing, tiling, and wiring./div

Experimental Design Research Philip Cash,Tino

Stanković,Mario Štorga,2016-05-17 This book presents a new, multidisciplinary perspective on and paradigm for integrative experimental design research. It addresses various perspectives on methods, analysis and overall research approach, and how they can be synthesized to advance understanding of design. It explores the foundations of experimental approaches and their utility in this domain, and brings together analytical approaches to promote an integrated understanding. The book also investigates

where these approaches lead to and how they link design research more fully with other disciplines (e.g. psychology, cognition, sociology, computer science, management). Above all, the book emphasizes the integrative nature of design research in terms of the methods, theories, and units of study—from the individual to the organizational level. Although this approach offers many advantages, it has inherently led to a situation in current research practice where methods are diverging and integration between individual, team and organizational understanding is becoming increasingly tenuous, calling for a multidisciplinary and transdisciplinary perspective. Experimental design research thus offers a powerful tool and platform for resolving these challenges. Providing an invaluable resource for the design research community, this book paves the way for the next generation of researchers in the field by bridging methods and methodology. As such, it will especially benefit postgraduate students and researchers in design research, as well as engineering designers.

Human Dimension and Interior Space Julius Panero, Martin Zelnik, 2014-01-21 The study of human body measurements on a comparative basis is known as anthropometrics. Its applicability to the design process is seen in the physical fit, or interface, between the human body and the various components of interior space. *Human Dimension and Interior Space* is the first major anthropometrically based reference book of design standards for use by all those involved with the physical planning and detailing of interiors, including interior designers, architects, furniture designers, builders, industrial designers, and students of design. The use of anthropometric data, although no substitute for good design or sound professional judgment should be viewed as one of the many tools required in the design process. This comprehensive overview of anthropometrics consists of three parts. The first part deals with the theory and application of anthropometrics and includes a special section dealing with physically disabled and elderly people. It provides the designer with the fundamentals of anthropometrics and a basic understanding of how interior design standards are established. The second part contains easy-to-read, illustrated anthropometric tables, which provide the most current data available on human body size, organized by age and percentile groupings. Also included is data relative to the range of joint motion and body sizes of children. The third part contains hundreds of dimensioned drawings, illustrating in plan and section the proper anthropometrically based relationship between user and space. The types of spaces range from residential and commercial to recreational and institutional, and all dimensions include metric conversions. In the Epilogue, the authors challenge the interior design profession, the building industry, and the furniture manufacturer to seriously explore the problem of

adjustability in design. They expose the fallacy of designing to accommodate the so-called average man, who, in fact, does not exist. Using government data, including studies prepared by Dr. Howard Stoudt, Dr. Albert Damon, and Dr. Ross McFarland, formerly of the Harvard School of Public Health, and Jean Roberts of the U.S. Public Health Service, Panero and Zelnik have devised a system of interior design reference standards, easily understood through a series of charts and situation drawings. With Human Dimension and Interior Space, these standards are now accessible to all designers of interior environments.
