Summary of Rebecca Fett's It Starts With The Egg Milkyway Media, 2022-04-21
Please note: This is a companion version & not the original book. Book Preview: #1 The first few weeks after fertilization are a major hurdle for embryos, and many stop developing at some point during this time. Only about a third of fertilized embryos survive to become a baby. #2 The most common type of chromosomal abnormality is the addition of a copy of chromosome 21, which is what causes Down syndrome. However, sometimes a missing chromosome or more complex errors can also occur. An egg with the incorrect number of chromosomes is aneuploid. #3 The impact of chromosomal abnormalities on the chance of conceiving and carrying to term is especially apparent in the IVF

context. If this factor is taken out of the equation, the pregnancy rates skyrocket. #4 Chromosomal screening is not a cureall. It can reveal that none of the embryos created in an IVF cycle are chromosomally normal, which can result in no good embryo available to transfer.

Value chains for nutritious food: Analysis of the egg value chain in the Tigray region of Ethiopia Hirvonen, Kalle, Baye, Kaleab, Headey, Derek D., Hoddinott, John F., 2020-10-07 Eggs have high potential for improving nutrition outcomes in low-income countries, yet very few children in such settings consume eggs on a regular basis despite widespread poultry

ownership. To redress this disconnect, a number of interventions have been implemented to improve household production of poultry products, as well as caregiver awareness of the nutritional benefits of eggs and other animal-sourced foods. However, very few of these interventions have tried to leverage food markets to improve nutrition, even though most rural people predominantly rely on markets for the majority of their non-staple food consumption. This study was implemented to better understand the constraints to purchasing eggs for consumption by young children in rural Ethiopia, with a view to informing the design of market-oriented interventions that might cost-effectively increase children's egg consumption. To do so we analyzed secondary datasets on poultry ownership, household and child egg consumption, and retail egg prices to understand egg markets and the egg value chain in Tigray. Similar to other contexts in sub-Saharan Africa, we find that two-thirds of households own poultry, though only one-quarter of young children consumed eggs in the past 24 hours. Although markets in Tigray are well integrated – likely because of the important role of egg aggregators – egg prices remain high. A modest consumption level of 2.5 eggs per person per week would cost around 10 percent of the total budget of households in the poorest quintile of households, even though eggs are more affordable than other animal-sourced foods. We find that egg consumption among young children is not constrained by fasting associated with Orthodox Christianity. High prices are likely the main constraint and are a function of low levels of

intensification in egg production, which is dominated by backyard poultry systems characterized by high mortality rates and low productivity.

History of the Egg of Clepsine Previous to Cleavage Charles Otis Whitman, 1878

The welfare of laying hens directive - implications for the egg industry
Great Britain: Parliament: House of Commons: Environment, Food and Rural Affairs Committee, 2011-09-02 The Environment, Food and Rural Affairs Committee warn of a potential commercial disaster over animal welfare regulations that could result in unfair competition for UK egg producers. New rules are designed to improve conditions for caged ('battery') hens. The Welfare of Laying Hens Directive (Council Directive 1999/74/EC), which applies to businesses with over 350 laying hens, provides that conventional cage systems must not be used after 1 January 2012. After this date, caged hens must be kept in 'enriched' cages, which have more living space per hen (750 cm² cage area per hen compared to 550 cm² in conventional cages - less than an A4 sheet of paper), a nest, perching space, litter to allow pecking and scratching, and unrestricted access to a feed trough. But around one third of Europe's egg production will not comply with the new welfare standards by 2012. UK egg producers have spent around £400 million to improve conditions for laying hens, and will be left at a competitive disadvantage if cheaper, illegal and non-compliant shell eggs and egg products can be imported to the UK from other European countries. The UK Government must

press for an intra-community trade ban on the export of non-compliant eggs and egg products, and the EU Commission should initiate infraction proceedings against Member States where caged egg producers remain non-compliant. Failure to enforce this new Directive effectively will set a worrying precedent for other legislation intended to improve the welfare of farm animals.
