Exposure of the American People to Iodine-131 from Nevada Nuclear-Bomb Tests National Research Council, Division on Earth and Life Studies, Institute of Medicine, Commission on Life Sciences, Committee on Exposure of the American People to I-131 from the Nevada Atomic Bomb Tests, Committee on Thyroid Screening Related to I-131 Exposure, 1999-06-17 In 1997, after more than a decade of research, the National Cancer Institute (NCI) released a report which provided their assessment of radiation exposures that Americans may have received from radioactive iodine released from the atomic bomb tests conducted in Nevada during the 1950s and early 1960s. This book provides an evaluation of the soundness of the methodology used by the NCI study to estimate: Past radiation doses. Possible health consequences of exposure to iodine-131. Implications for clinical practice. Possible public health strategiesâ€such as systematic screening for thyroid cancerâ€to respond to the exposures. In addition, the book provides an evaluation of the NCI estimates of the number of thyroid cancers that might result from the nuclear testing program and provides guidance on approaches the U.S. government might use to communicate with the public about Iodine-131 exposures and health risks.

<u>United States Nuclear Tests</u>, 2000 This document lists chronologically and alphabetically by name all nuclear tests and simultaneous detonations conducted by the United States from July 1945 through September 1992. Two nuclear weapons that the United States exploded over Japan ending World War II are not listed. These detonations were not tests in the sense that they were conducted to prove that the weapon would work as designed (as was the first test near Alamogordo, New Mexico on July 16, 1945), or to advance nuclear weapon design, or to determine weapons effects, or to verify weapon safety as were the more than one thousand tests that have taken place since June 30,1946. The nuclear weapon (nicknamed Little Boy) dropped August 6,1945 from a United States Army Air Force B-29 bomber (the Enola Gay) and detonated over Hiroshima, Japan had an energy yield equivalent to that of 15,000 tons of TNT. The nuclear weapon (virtually identical to Fat Man) exploded in a similar fashion August 9, 1945 over Nagaski, Japan had a yield of 21,000 tons of TNT. Both detonations were intended to end World War II as quickly as possible. Data on United States tests were obtained from, and verified by, the U.S. Department of Energy's three weapons laboratories -- Los Alamos National Laboratory, Los Alamos, New Mexico; Lawrence Livermore National Laboratory, Livermore, California; and Sandia National Laboratories, Albuquerque, New Mexico; and the Defense Threat Reduction Agency. Additionally, data were obtained from public announcements issued by the U.S. Atomic Energy Commission and its successors, the U.S. Energy Research and Development Administration, and the U.S. Department of Energy, respectively.

Bargaining on Nuclear Tests Or Rabinowitz,2014-04 Bargaining on Nuclear Tests tells the yet untold story of how Washington under Ronald Reagan's presidency duplicated the nuclear deal on ambiguity reached with Israel in 1969 in its dealings with Pakistan and South Africa in 1981. It puts the story of nuclear tests at the heart of a new Cold War historical narrative.

Silencing the Bomb Lynn R. Sykes,2017-12-12 In December 2016, the Bulletin of Atomic Scientists moved their iconic "Doomsday Clock" thirty seconds forward to two and a half minutes to midnight, the latest it has been set since 1952, the year of the first United States hydrogen bomb test. But a group of scientists—geologists, engineers, and physicists—has been fighting to turn back the clock. Since the dawn of the Cold War, they have advocated a halt to nuclear testing, their work culminating in the Comprehensive Test Ban Treaty, which still awaits ratification from China, Iran, North Korea—and the United States. The backbone of the treaty is every nation's ability to independently monitor the nuclear activity of the others. The noted seismologist Lynn R. Sykes, one of the central figures in the development of the science and technology used in monitoring, has dedicated his career to halting nuclear testing. In Silencing the Bomb, he tells the inside story behind scientists' quest for disarmament. Called upon time and again to testify before Congress and to inform the public, Sykes and his colleagues were, for much of the Cold War, among the only people on earth able to say with certainty when and where a bomb was tested and how large it was. Methods of measuring earthquakes, researchers realized, could also detect underground nuclear explosions. When

politicians on both sides of the Iron Curtain attempted to sidestep disarmament or test ban treaties, Sykes was able to deploy the nascent science of plate tectonics to reveal the truth. Seismologists' discoveries helped bring about treaties limiting nuclear testing, but it was their activism that played a key role in the effort for peace. Full of intrigue, international politics, and hard science used for the global good, Silencing the Bomb is a timely and necessary chronicle of one scientist's efforts to keep the clock from striking midnight.

Nuclear Tests Charles S. Shapiro, Valerie I. Kiselev, Eugene V. Zaitsev, 2013-04-17 This volume focuses on the human exposures and medical effects studies in the Semipaiatinsk! Altai region of Siberia that were a consequence of the radioactive fallout from nuclear test explosions that took place at the Semipalatinsk Test Site of the former Soviet Union. It contains a detailed account of a NATO Advanced Research Workshop (ARW) devoted to the subject, and a selection of the papers presented. The title of the ARW was Long-term Consequences of Nuclear Tests for the Environment and Population Health (Semipaiatinsk/Altai Case Studies). The estimated exposures to large numbers of people in the Altai lie in an important dose rate and dose domain. Hence the research reported herein provides new and unique information on the effects of radiation on humans. Also emphasized at the ARW were studies involving fallout from the Pacific Island tests of the U. S. A.. There have been over 2300 nuclear weapon test explosions to date. More than 500 took place in the atmosphere and outer space; the remainder were underground. The atmospheric tests comprise the largest source of anthropogenic radioactivity released into the earth's atmosphere to date. The vast majority, in number and yield, were carried out by the former Soviet Union (FSU) and the United States. Each superpower maintained two primary test sites, one continental primarily for small yield tests, and the other more remote for larger yield tests. For the U.S.A.

The Comprehensive Nuclear Test Ban Treaty National Research Council, Policy and Global Affairs, Committee on Reviewing and Updating Technical Issues Related to the Comprehensive Nuclear Test Ban Treaty, 2012-04-29 This report reviews and updates the 2002 National Research Council report, Technical Issues Related to the Comprehensive Nuclear Test Ban Treaty (CTBT). This report also assesses various topics, including: the plans to maintain the safety and reliability of the U.S. nuclear stockpile without nuclear-explosion testing; the U.S. capability to detect, locate, and identify nuclear explosions; commitments necessary to sustain the stockpile and the U.S. and international monitoring systems; and potential technical advances countries could achieve through evasive testing and unconstrained testing. Sustaining these technical capabilities will require action by the National Nuclear Security Administration, with the support of others, on a strong scientific and engineering base maintained through a continuing dynamic of experiments linked with analysis, a vigorous surveillance program, adequate ratio of performance margins to uncertainties. This report also emphasizes the use of modernized production facilities and a competent and capable workforce with a broad base of nuclear security expertise.

Assessment of the Scientific Information for the Radiation Exposure Screening and Education Program National Research Council, Division on Earth and Life Studies, Board on Radiation Effects Research, Committee to Assess the Scientific Information for the Radiation Exposure Screening and Education Program, 2005-10-01 The Radiation Exposure Compensation Act (RECA) was set up by Congress in 1990 to compensate people who have been diagnosed with specified cancers and chronic diseases that could have resulted from exposure to nuclear-weapons tests at various U.S. test sites. Eligible claimants include civilian onsite participants, downwinders who lived in areas currently designated by RECA, and uranium workers and ore transporters who meet specified residence or exposure criteria. The Health Resources and Services Administration (HRSA), which oversees the screening, education, and referral services program for RECA populations, asked the National Academies to review its program and assess whether new scientific information could be used to improve its program and determine if additional populations or geographic areas should be covered

under RECA. The report recommends Congress should establish a new science-based process using a method called probability of causation/assigned share (PC/AS) to determine eligibility for compensation. Because fallout may have been higher for people outside RECA-designated areas, the new PC/AS process should apply to all residents of the continental US, Alaska, Hawaii, and overseas US territories who have been diagnosed with specific RECA-compensable diseases and who may have been exposed, even in utero, to radiation from U.S. nuclear-weapons testing fallout. However, because the risks of radiation-induced disease are generally low at the exposure levels of concern in RECA populations, in most cases it is unlikely that exposure to radioactive fallout was a substantial contributing cause of cancer.

Nuclear Weapons, Do We Need Them? N. Kunju,1996

The Nevada Test Site Emmet Gowin, 2019-10-08 Emmet Gowin likes to ask a provocative question: Which country on earth has had the largest number of nuclear bombs detonated within its borders? The answer is the United States. Covering approximately 680 square miles, the Nevada National Security Site, formerly known as the Nevada Test Site, was the primary testing location of American nuclear devices from 1951 to 1992; 1,021 announced nuclear tests occurred there, 921 of which were underground. The site, which is closed to the public, including its airspace, contains 28 areas, 1,100 buildings, 400 miles of paved roads, 300 miles of unpaved roads, 10 heliports, and two airstrips. Its surface is covered with subsidence craters from testing, and in places looks like the moon. In 1996, Gowin received permission to document the landscape by air, after over a decade of working to secure access. These aerial views of environmental devastation--made quietly majestic but no less potent in the hands of a master photographer--unveil environmental travesties on a grand scale. While groups of images from the Nevada Test Site series have been published previously, this book will produce the largest number yet, and three quarters of the pictures will not have been published at all. Gowin is the only photographer to have been granted access to this site, which is now permanently closed, post-9/11. Other than images made by the government for geographic purposes, no other images of this landscape exist. The book will feature a preface by photographer Robert Adams (America, b. 1937), whose photographic and written work is concerned with landscape, urbanization, and activism. It will also feature an afterword by Gowin on how he made the images, and their significance to him today.--Provided by publisher.

Under the Cloud Richard Lee Miller,1986 In a chilling documentary history of America's aboveground nuclear tests conducted during the 1950s and early 1960s, Miller takes on the subject and universalizes it, at the same time giving it the flavor of a Dos Passos novel (Kirkus Reviews).

Survey of Hazardous Materials Used in Nuclear Testing Ernest A. Bryant,1991 The use of hazardous' materials in routine underground nuclear tests at the Nevada Test Site has been reviewed. In addition the inventory of test yields, originally reported in 1976 has been updated. A trail down-hole inventory' has been conducted for a selected test. The inorganic hazardous materials introduced during testing (with the exception of lead and the fissionable materials) produce an incremental change in the quantity of such materials already present in the geologic media surrounding the test points. 1 ref., 3 tabs.

Restricted Data Alex Wellerstein,2021-04-09 Nuclear weapons, since their conception, have been the subject of secrecy. In the months after the dropping of the atomic bombs on Hiroshima and Nagasaki, the American scientific establishment, the American government, and the American public all wrestled with what was called the problem of secrecy, wondering not only whether secrecy was appropriate and effective as a means of controlling this new technology but also whether it was compatible with the country's core values. Out of a messy context of propaganda, confusion, spy scares, and the grave counsel of competing groups of scientists, what historian Alex Wellerstein calls a new regime of secrecy was put into place. It was unlike any other previous or since. Nuclear secrets were given their own unique legal designation in American law (restricted data), one that operates differently than all other forms of national security classification and exists to this day. Drawing on massive amounts of declassified files, including records released by the government for the first time at the author's request, Restricted Data is a narrative account of nuclear secrecy and the tensions and uncertainty that built as the Cold War continued. In the US, both science and democracy are pitted against nuclear secrecy, and this makes its history uniquely compelling and timely--

Monitoring the Comprehensive Nuclear-Test-Ban Treaty Frode Ringdal, Brian L.N. Kennett, Brian Leslie Norman Kennett, 2001-04 In September 1996, the United Nations General Assembly adopted the Comprehensive Nuclear-Test-Ban Treaty (CTBT), prohibiting nuclear explosions worldwide, in all environments. The treaty calls for a global verification system, including a network of 321 monitoring stations distributed around the globe, a data communications network, an international data centre (IDC), and on-site inspections, to verify compliance. This volume contains research papers focusing on seismic ecent location in the CTBT context. The on-site inspection protocol of the treaty specifies a search area not to exceed 1000 square km. Much of the current research effort is therefore directed towards refining the accuracy of event location by including allowances for three-dimensional structure within the Earth. The aim is that the true location of each event will lie within the specified source zone regarding postulated location. The papers in this volume cover many aspects of seismic event location, including the development of algorithms suitable for use with three-dimensional models, allowances for regional structure, use of calibration events and source-specific station corrections. They provide a broad overview of the current international effort to improve seismic event location accuracy, and the editors hope that it will stimulate increased interest and further advances in this important field.

Monitoring the Comprehensive Nuclear-Test-Ban Treaty: Data Processing and Infrasound Zoltan A. Der,Robert H. Shumway,Eugene T. Herrin,2002-05-01 On September 10, 1996, The United Nations General Assembly adopted the Copmprehensive Nuclear-Test-Ban Treaty (CTBT), prohibiting nuclear explosions worldwide, in all environments. The treaty calls for a global verification system, including a network of 321 monitoring stations distributed around the globe, a data communications network, an international data center (IDC), and on-site inspections, to verify compliance. This volume presents certain recent research results pertaining on methods used to process data recorded by instruments of the International Monitoring System (IMS) and addressing recording infrasound signals generated by atmospheric explosions. Six papers treating data processing provide an important selection of topics expected to contribute to improving our ability to successfully monitor a CTBT. Five papers concerning infrasound include descriptions of ways in which that important research area can contribute to CTBT monitoring, the automatic processing of infrasound data, and site conditions that serve to improve the quality of infrasound data.

<u>Political Fallout</u> Toshihiro Higuchi,2020-04-28 Political Fallout is the story of one of the first human-driven, truly global environmental crises--radioactive fallout from nuclear weapons testing during the Cold War--and the international response. Beginning in 1945, the United States, Britain, and the Soviet Union detonated hundreds of nuclear weapons in the atmosphere, scattering a

massive amount of radioactivity across the globe. The scale of contamination was so vast, and radioactive decay so slow, that the cumulative effect on humans and the environment is still difficult to fully comprehend. The international debate over nuclear fallout turned global radioactive contamination into an environmental issue, eventually leading the nuclear superpowers to sign the landmark Partial Test Ban Treaty (PTBT) in 1963. Bringing together environmental history and Cold War history, Toshihiro Higuchi argues that the PTBT, originally proposed as an arms control measure, transformed into a dual-purpose initiative to check the nuclear arms race and radioactive pollution simultaneously. Higuchi draws on sources in English, Russian, and Japanese, considering both the epistemic differences that emerged in different scientific communities in the 1950s and the way that public consciousness around the risks of radioactive fallout influenced policy in turn. Political Fallout addresses the implications of science and policymaking in the Anthropocene--an era in which humans are confronting environmental changes of their own making.
