Thunderstorms--a Social, Scientific, & Technological Documentary: Instruments and techniques for thunderstorm observation and analysis ,1982

Doppler Radar Investigation of Flow Patterns Within Thunderstorms Michael J. Kraus,1974 Information on airflow in six New England thunderstorms was obtained from quasi-horizontal observations by a single Doppler radar. Radial velocity fields in four of the storms showed well organized patterns throughout an appreciable range of height. Vertical cross sections of the horizontal component field, coupled with some reflectivity information, provided a basis for inferring regions where vertical motion was strong. Computed horizontal flow fields consistent with the observed component fields showed environmental flow basically through the storm except at mid-levels.

Thunderstorm Analysis in the Northern Rocky Mountains DeVer Colson,1957

An Analysis of the Performance of the Three-station SPARSA Network for Detecting and Tracking Thunderstorm Activity Bernard D. Weiss,1968 This report presents an operational evaluation of the fully configured, three-station SPARSA network at Cape Kennedy Air Force Station. The purpose of the evaluation was to determine the network's ability to detect and track thunderstorms and to show the growth and decay of active cells in the triangulation area depicted on the display console. The data were collected over a period of 37 days in the summer of 1967 and include a total of 70 thunderstorms. The tests indicate that when manned continuously the SPARSA equipment successfully identified all known areas of electrical activity and in most cases provided ample warnings of storm growth and decay within a 50-mile radius of the Cape Kennedy Control Center. Surface weather observations in and around the triangulation area were used to verify

SPARSA information. (Author)

Satellite Climatology of Thunderstorm Initiation Sites in the Rocky Mountains of Colorado and Northern New Mexico Crystal L. B. Schaaf, 1986 A number of mechanisms produce the convection necessary to initiate thunderstorms over mountainous terrain (that is, orographic lifting, channeling, wake effects, and leeside convergence zones). Mountain ranges are often poorly populated and instrumented, and forecasting severe mountain storms can be a problem. However, studies of satellite imagery of the Rockies of Colorado and northern New Mexico have emphasized the importance of certain topographic regions in producing convection. By tracing individual summer thunderstorms back through time to their initiation sites, it has been possible to identify specific mountainous areas that repeatedly serve as genesis regions for thunderstorms. The identification of these genesis regions and the terrain mechanisms at work. An understanding of the wind regimes and moisture fields is also necessary to recognize the conditions necessary to activate each region. This report is the culmination of a 3-year study of satellite imagery and thunderstorm initiation sites of the Rocky Mountains. (Author).

Storm Data, 1997

Radar Detection of Turbulence in Thunderstorms Alan R. Bohne, 1981 Theoretical investigations are undertaken to relate intensity of turbulent air motion to Doppler radar spectrum mean and

variance in precipitation environments. Examples of theoretical radar derived turbulence power density spectra and total precipitation motion variance show that effects due to imperfect particle response are significant for turbulence scale lengths less than 250 m. Doppler spectrum variance and estimated eddy dissipation rate (epsilon) are found strongly dependent upon precipitation environment for ranges less than about 20 km, and for cases where the turbulence outer scale length (lambda) is less than 0.5 km. They are also found to be essentially independent of lambda when the maximum pulse volume dimension is less than 1/2 lambda, and independent of range but strongly dependent on lambda at ranges where the maximum pulse volume dimension is greater than lambda. Estimation of epsilon by radar is shown to be unreliable until a method of remotely determining lambda is found. Nevertheless, classification of turbulence severity (index = cube root of epsilon) is possible with only a reasonable guess of lambda. Analyses of aircraft/gust velocity data indicate that thunderstorm turbulence is localized into discrete patches, and that such localization must be accounted for when aircraft gust velocity data undergo power spectrum analysis.

Weather 101 Kathleen Sears, 2017-09-12 *Weather 101* gives you the basics on weather, from blue skies to hail to dust storms, with information on the science of how weather works, how to predict the weather in your area, how to be ready for natural disasters, and how climate change is affecting weather patterns across the world. --

A Preliminary Report on Doppler Radar Observation of Turbulence in a Thunderstorm

Ralph J. Donaldson, 1967 Vertical-incidence observations by Doppler radar of velocities in a thunderstorm reveal some regions in which the spread of velocities is unusually broad. The widths of

the vertical velocity spectra are generally greatest along the edges of a major updraft, where the maximum shear in updraft speed also occurs. The observations indicate that turbulence is an important cause of the abnormally wide velocity spectra, and suggest the utility of Doppler radar measurements of the vertical velocity spectrum as an indicator of severe cloudy-air turbulence. Furthermore, vertical velocity spectra in the more convective regions of thunderstorms, where they may be seriously affected by turbulence and wind shear, probably give an exaggerated picture of the particle size distribution. A Thunderstorm Prediction Technique Based on a Perfect-prog Approach ,1999 We have developed a thunderstorm prediction technique for use with a mesoscale model to satisfy Air Force Weather's Theater Battle Management (TBM) stated requirement for maximum cloud tops and coverage. The prediction technique is to be implemented in the Global Theater/Weather Analysis and Prediction system (GTWAPS). A perfect-prog approach was implemented using synoptic and subsynoptic-scale data for diagnosis and short-range probability forecasts. Future work is discussed, including, most importantly, follow-on testing and refinements of the techniques. -- Report documentation page.
