**Tides** David George Bowers, Emyr Martyn Roberts, 2019-11-28 The tide is the greatest synchronised movement of matter on our planet. Every drop of seawater takes part in tidal motion, driven by the gravitational pull of the moon and sun. At the coast, we see the tide as a twice-daily rise and fall of sea level that moves the edge of the sea up and down a beach or cliff-face. In some places, the tide is small but at others it can rise in a few hours by the height of a three storey building; it then has to be treated with great respect by those who live and work by the sea. In this Very Short Introduction David George Bowers and Emyr Martyn Roberts explore what we know about the tides. Blending clear explanations of well known tidal phenomena with recent insights in the deep ocean and coastal seas, Bowers and Roberts use examples from around the world, to tell the story of the tide, considering its nature and causes, its observation and prediction, and unusual tides and their relevance. They explore why tides have attracted the attention of some of the world's greatest scientists, from the initial challenge of explaining why there are two tides a day when the moon and sun pass overhead just once; a problem that was solved by Isaac Newton. In the 19th century, scientists unravelled the rhythms of the tide; good tidal predictions in the form of tide tables were then possible. The predictions were made on beautiful tide predicting machines constructed of brass and mahogany, some of which can still be seen in maritime museums. In the 20th century, the importance of tides as mixers of sea water became evident. As Bowers and Roberts explore, tidal mixing of the ocean is essential for maintaining its deep circulation, a key part of the climate-control system of our planet. In inshore waters, tidal mixing enhances biological productivity, influences sea temperature and turbidity and creates dramatic features such as maelstroms and tidal bores. In the 21st century, space probes are examining the effects of tidal processes on the moons of Jupiter and Saturn and the possibility of tidally-heated liquid oceans with their own ecosystems. Looking to the cutting edge of tidal research, Bowers and Roberts also consider how we can study the role of the tide in the geological and biological evolution of our own planet with innovative computer models. ABOUT THE SERIES: The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area. These pocket-sized books are the perfect way to get ahead in a new subject quickly. Our expert authors combine facts, analysis, perspective, new ideas, and enthusiasm to make interesting and challenging topics highly readable.

**Times & Tides** Gavin Souter, 2012 Only a stone's throw from central Sydney, the northern arm of Port Jackson, otherwise known as Middle Harbour, has a mystique all of its own. Unlike most Australian city environs, Middle Harbour was almost entirely neglected during the first two centuries of European settlement. As such, it still contains regions of virtually untouched bushland, and a surprising history to match. Times & Tides by acclaimed historian Gavin Souter is an exploration of this unique – and precious – part of Australia. In prose that is lucid and informed, Souter trawls back and forth in time to create an evocative and multi-layered narrative encompassing Aboriginal life, European arrival, modern suburbs and the natural history of

bays, creeks and the bush. Fascinating and insightful, *Times & Tides* is also a very personal account by someone who has lived within sight of Middle Harbour for almost fifty years. First published in 2004, and rereleased now for the first time digitally, *Times & Tides* won the North Shore Historical Society's Isabella Brierley Prize.

**Oceanic Internal Tides: Observations, Analysis and Modeling** Eugene G. Morozov, 2018-02-08 This book presents a detailed study of the structure and variability of internal tides and their geographical distribution in the ocean. Based on experimental analysis of oceanic measurements combined with numerical modeling, it offers a comprehensive overview of the internal wave processes around the globe. In particular, it is based on moored buoys observations in many regions in all oceans (Atlantic, Pacific, Indian, Arctic, and Southern) that have been carried out by researchers from different countries for more than 40 years as part of various oceanographic programs, including WOCE and CLIVAR. However, a significant portion of the data was collected by the author, who is a field oceanographer. The data was processed and interpreted on the basis of the latest knowledge of internal wave motion. The properties of internal waves were analyzed in relation to the bottom topography and mean state of the ocean in specific regions. Internal waves play a major role in the formation of seawater stratification and are responsible for the main processes of ocean dynamics, such as energy transfer and mixing. One of the most significant ideas presented in this book is the generation of internal tides over submarine ridges. Energy fluxes from submarine ridges related to tidal internal waves greatly exceed the fluxes from continental slopes. Submarine ridges form an obstacle to the propagation of tidal currents, which can cause the creation of large amplitude internal tides. Energy fluxes from submarine ridges account for approximately one fourth of the total energy dissipation of the barotropic tides. Model simulations and moored measurements have been combined to generate a map of global distribution of internal tide amplitudes. This book is of interest to oceanographers, marine biologists, civil engineers, and scientists working in climate research, fluid mechanics, acoustics, and underwater navigation.

*The User's Guide to the Australian Coast* Greg Laughlin, 1997 Most Australians live near or on the coast, and sailing and fishing are national pastimes. This book aims to provide information on everything the reader needs to know about the wind, weather, tides and currents. In simple language the book describes: beaches and how to recognise rips and how to identify safe swimming areas; winds and how strong they will be in the exact area you are sailing; tides and how high the tide is likely to be at the spot you intend to fish; currents and where they will take you; waves and just how high they are going to reach; and storms and how to identify bad weather on

its way and how to sail safely through it. The book uses photographs and colour-coded diagrams for ease of use.
