**Advanced J2EE Platform Development** Torbjörn Dahlén, Thorbiörn Fritzson, 2004 A proven Java(TM)-based approach to standardizing and streamlining legacy migration This book focuses on the key challenges developers face when using the Java 2 platform Enterprise Edition (J2EE) to encapsulate legacy applications for delivery in a multi-tier Internet environment. Leading Sun architects Torbjörn Dahlen and Thorbiörn Fritzson show how to standardize encapsulation using an integration tier that shields the J2EE elements of an application from the properties and demands of its legacy elements. Using this approach, enterprises can promote reuse, accelerate legacy migration projects, and make the most of their COBOL/mainframe and Java expertise. Above all, they can take portability beyond hardware and operating systems, systematically migrating virtually any legacy system without extensive redesign or reprogramming. Presents a pragmatic approach to domain modeling for legacy application migration Promotes reuse and portability through a standardized, fine-grained domain object model Shows how to streamline the transformation of domain models to working systems Introduces a proven, pattern-based J2EE application architecture for Internet-enabling legacy systems Includes superior algorithms for object queries, data cleansing and merging, and artificial XA support Advanced J2EE Platform Development presents detailed examples and sample code, including a start-to-finish case study that demonstrates integration between three different legacy systems.
