Small Town and Village in Bavaria Peter H. Merkl, 2012 At the center of this investigation is the great modernization effort of a West German state, Bavaria, in the 1970s and 1980s, by means of a reform of the smaller units of local government. The reforms were meant to abolish all autonomous local governments serving populations of fewer than 3,000, thereby reducing the number of local governments in Bavaria from more than 7,000 to less than 2,000. Based on interviews, surveys, and statistical research, this study chronicles fifteen communities and their challenges, developments, and social changes from post-1945 up to the present. While this book explores the decline of the iconic village community, it also reveals the survival of medieval towns in a contemporary world, and despite the modern desire for comprehensive and well-integrated services, there remains a seemingly perennial appeal of small town and village life. Peter H. Merkl is Professor Emeritus of Political Science at the University of California, Santa Barbara. He has published extensively on comparative and German government and politics, in particular the origin of the West German Republic and German unification. He also edited a series of volumes on German politics.

Validity Generalization Kevin R. Murphy, 2013-03-07 This volume presents the first wide-ranging critical review of validity generalization (VG)--a method that has dominated the field since the publication of Schmidt and Hunter's (1977) paper *Development of a General Solution to the Problem of Validity Generalization*. This paper and the work that followed had a profound impact on the science and practice of applied psychology. The research suggests that fundamental relationships among tests and criteria, and the constructs they represent are simpler and more regular than they appear. Looking at the history of the VG model and its impact on personnel psychology, top scholars and leading researchers of the field review the accomplishments of the model, as well as the continuing controversies. Several chapters significantly extend the maximum likelihood estimation with existing models for meta analysis and VG. Reviewing 25 years of progress in the field, this volume shows how the model can be extended and applied to new problems and domains. This book will be important to researchers and graduate students in the areas of industrial organizational psychology and statistics.

Molecular Beam Epitaxy John Wilfred Orton, Tom Foxon, 2015 The book is a history of Molecular Beam Epitaxy (MBE) as applied to the growth of semiconductor thin films (note that it does not cover the subject of metal thin films). It begins by examining the origins of MBE, first of all looking at the nature of molecular beams and considering their application to fundamental physics, to the development of nuclear magnetic resonance and to the invention of the microwave MASER. It shows how molecular beams of silane (SiH₄) were used to study the nucleation of silicon films on a silicon substrate and how such studies were extended to compound semiconductors such as GaAs. From such surface studies in ultra-high vacuum the technique developed into a method of growing high quality single crystal films of a wide range of semiconductors. Comparing this with earlier evaporation

methods of deposition and with other epitaxial deposition methods such as liquid phase and vapour phase epitaxy (LPE and VPE). The text describes the development of MBE machines from the early 'home-made' variety to that of commercial equipment and show how MBE was gradually refined to produce high quality films with atomic dimensions. This was much aided by the use of various in-situ surface analysis techniques, such as reflection high energy electron diffraction (RHEED) and mass spectrometry, a feature unique to MBE. It looks at various modified versions of the basic MBE process, then proceed to describe their application to the growth of so-called 'low-dimensional structures' (LDS) based on ultra-thin heterostructure films with thickness of order a few molecular monolayers. Further chapters cover the growth of a wide range of different compounds and describe their application to fundamental physics and to the fabrication of electronic and opto-electronic devices. The authors study the historical development of all these aspects and emphasise both the (often unexpected) manner of their discovery and development and the unique features which MBE brings to the growth of extremely complex structures with monolayer accuracy.

Readings in Machine Translation Sergei Nirenburg,H. L. Somers,Yorick Wilks,2003 The field of machine translation (MT) - the automation of translation between human languages - has existed for more than 50 years. MT helped to usher in the field of computational linguistics and has influenced methods and applications in knowledge representation, information theory, and mathematical statistics.

Functions of the Cortico-Basal Ganglia Loop Minoru Kimura,Ann M. Graybiel,2012-12-06 In this volume, which is based on the proceedings of the international symposium Functional Linkages Between the Cerebral Cortex and Basal Ganglia in the Control of Voluntary Movement, held December 1993 in Osaka, Japan, the world's leading neuroscientists present the most up-to-date findings of current research on cortico-basal ganglia relations. Topics addressed in this book include the structure and function of basal ganglia cells and systems, the organization of thalamo-cortical systems, the frontal cortex, and clinical applications of ongoing studies. Of particular interest is the analysis of models of motor learning and functional schemes of cortico-basal ganglia and striatal circuitry. The valuable new insights this interdisciplinary work provides will benefit researchers and students in fields such as neurobiology, behavioral neurophysiology, neurochemistry, and neuropharmacology.

Machine Translation Yorick Wilks,2008-10-30 A history of machine translation (MT) from the point of view of a major writer and innovator in the field is the subject of this book. It details the deep differences between rival groups on how best to do MT, and presents a global perspective covering historical and contemporary systems in Europe, the US and Japan. The author considers MT as a fundamental part of Artificial Intelligence and the ultimate test-bed for all computational linguistics.

Germanic Linguistics Rosina Lippi-Green, Joe Salmons, 1996-01-01 This volume contains ten revised and expanded papers selected from the dozens presented at the last Michigan-Berkeley Germanic Linguistics Roundtable, five contributions each from syntax (by Werner Abraham, Sarah Fagan, Isabella Barbier, John te Velde, and Ruth Lanouette) and historical linguistics (by Garry Davis and Gregory Iverson, Mary Niepokuj, Neil Jacobs, Edgar Polomé, and David Fertig). The authors start from current theoretical discussions in syntactic and diachronic research, using theory to address longstanding but still current problems in Germanic linguistics, from clitic placement and verb-second phenomena through the Verschärfung to the Twaddellian view of umlaut. Each contribution relies on careful sifting of data situated in the relevant comparative context, Germanic, Indo-European and cross-linguistic.
