Visual Memory Timothy F. Brady, Wilma A. Bainbridge, 2022 Featuring contributions from world-leading researchers, this book explores the relationship between visual perception and memory. It bridges the traditionally separate fields of vision science and recognition memory and deals with an interdisciplinary set of perspectives combining research in psychology, neuroscience, and artificial intelligence. The book makes new connections between the wealth of research from each respective field, developing the idea that visuospatial memory is our best memory system. This volume traverses topics grounded in both empirical study and real-world applications, including working (short-term) memory, long-term memory, the neuroscience of memory, development of memory over the lifespan, autobiographical memories, false memories, and eyewitness testimony. It argues that an increased knowledge of how visuospatial memory works can lead to an improved understanding of the basic features of memory, as well as providing strategies for memory improvement. The book features cutting edge visual memory research, where converging methods in psychophysics, cognitive neuroscience, and computational modelling have been propelling the field forward. Visual Memory is an essential read for all students and researchers of memory and visual perception. It will also be useful for researchers and students in related fields including human-computer interaction, data visualization, cognitive science, and cognitive enhancement--

The Visual World in Memory James R. Brockmole, 2017-03-02 The book examines how well we remember what we see. Research in human memory for visual material varies tremendously across the time scales, stimuli, and scenarios of interest. Because of these distinct pursuits, research in the field of 'visual memory' is in practice rather compartmentalized and as such is disseminated across a range of literatures. The Visual World in Memory pulls together this disparate field with a series of chapters, each written by a leading expert, that concisely present the state-of-the-science in all the areas of research. The result is a single source of information that bridges the divides that separate the field as a whole. Each chapter reviews and analyzes current theories and controversies regarding such issues as visual and spatial working memory, memory for visual features,

conjunctions, objects, and locations, memory for faces, memory for real-world scenes, memory for visual events, the role of visual memory in motor planning and action, the relationship between visual memory, reference frames, and navigation, and visual imagery. The rigorous discussion and analysis included in each chapter will appeal to established researchers and vision scientists whilst the breadth of the book will make it an ideal companion for students learning about memory.

Eye Movements and Visual Cognition Keith Rayner, 2012-12-06 Edited by a leading scholar in the field, *Eye Movements and Visual Cognition* presents an up-to-date overview of the topics relevant to understanding the relationship between eye movements and visual cognition, particularly in relation to scene perception and reading. Cognitive psychologists, neuropsychologists, educational psychologists, and reading specialists will find this volume to be an authoritative source of state-of-the art research in this rapidly expanding area of study.

Comprehensive Handbook of Psychological Assessment, Volume 1 Gerald Goldstein, Sue R. Beers, 2003-09-22 In one volume, the leading researchers in intelligence and neuropsychological assessment interpret the range of issues related to intellectual and neuropsychological tests, including test development and psychometrics, clinical applications, ethical and legal concerns, use with diverse populations, computerization, and the latest research. Clinicians and researchers who use these instruments will find this volume invaluable, as it contains the most comprehensive and up-to-date information available on this important aspect of practice.

Clinical Interpretation of the WAIS-III and WMS-III David S. Tulskey, 2003-05-07 This guide to the WAIS-III and WMS-III tests is written to help clinical practitioners achieve efficient and accurate interpretations of test results. The only interpretive guide to be based on data obtained while standardizing the tests, this reference source provides new models for interpreting results, as well as practical information on the diagnostic validity, demographically corrected norms, and accuracy of the tests in measuring intelligence and memory. The focus of information is to allow clinicians to reduce variance in the interpretations of scores, indicating how best to factor in socio-economic status of respondents, interpreting meaningful change in serial assessments, and scoring with alternate or omitted sub-tests. Also included in the book are chapters on accommodating clients with disabilities. The final chapter discusses frequently asked questions (with answers) on the use and interpretation of the tests, as well as practical issues to help make scoring time-efficient and accurate. Only guide to be based on data obtained in the standardization of the tests Practical examples given to help guide interpretation of scores Focuses on information to make faster, more accurate scoring interpretations

Diagnostic Assessment of Learning Disabilities in Childhood Amber E. Brueggemann Taylor, 2014-02-14 Diagnosing learning disabilities (LD) in children has never been an easy task. The multiple approaches in use complicate the assessment process, raising the risk of young students getting the wrong services, or none at all. It is clear that more accurate diagnosis and classification methods are needed to advance the prevention and treatment of difficulties in reading and mathematics. *Diagnostic Assessment of Learning Disabilities in Childhood* takes important steps to cut through the confusion. This timely resource weighs the strengths and weaknesses of commonly used assessment methods including the aptitude-achievement discrepancy, cognitive processing, RTI and low achievement approaches and introduces the author's academic impairment model as a promising alternative. A chapter on comorbid disorders in students with LD guides readers in the fine points of differential diagnosis. And to make the coverage especially practical, the book's features link the theoretical to the real-world practice of LD assessment, among them: Overviews of LD identification and definitions. Analysis of widely used diagnostic approaches with strengths and weaknesses. Examples of assessment protocols and report writing. Case examples illustrating diagnostic issues. Q&A sections with leading experts in the field. Useful summaries, appendices and resource links. *Diagnostic Assessment of Learning Disabilities in Childhood* is an invaluable reference for school and clinical child psychologists, special education and allied educational professionals and researchers and graduate students in school, educational and clinical child psychology who are dedicated to higher measurement standards and greater opportunities for children's academic success.

Handbook of Nonverbal Assessment R. Steve McCallum, 2003 The goal of this Handbook is to describe the current assessment strategies and related best practices to professionals who serve individuals from diverse cultures or those who have difficulty using the English language. It will be a valuable resource for school psychologists, special educators, speech and hearing specialists, rehabilitation counselors, as well as graduate-level students of school psychology and child and family psychology.

Visual and Motor Cognition in Infants and Children Christiane Lange-Küttner, 2024-03-21 This insightful book offers an authoritative yet accessible introduction to the development of visual abilities and motor skills in infants and children. Based on theory and cutting-edge up-to-date research about the development of non-verbal intelligence, it provides readers with essential knowledge about the foundations of typical and atypical development. Split into two parts, the book begins by describing the development of components of non-verbal intelligence in typical development. Several studies are presented that document the importance of a transition from an object-place to objects-region encoding for proper spatial categorisation. In the second part, the book discusses which of the visual, spatial, motor, imagery, categorisation, memory and planning processes may be affected in children with attention deficit hyperactivity disorder (ADHD), autistic spectrum disorder (ASD) and developmental coordination disorder (DCD). Lange-Küttner introduces a Spatial Model that integrates object salience, speed and abstraction of spatial patterns of locations, re-occurring at different ages. She also develops a Spatial Freedom Theory that argues that spatial containment, constraints and exploration belong together. The book encourages and stimulates new research ideas by discussing the most important research results to date and identifying new research questions. This text will be of interest to students and instructors as well as researchers in the fields of developmental, clinical, educational and cognitive psychology as well as neuroscience and physical education.

Change Blindness and Visual Memory Daniel J. Simons, 2000-01-01 A central goal in the study of object and scene perception is to understand

how visual information is integrated across views to provide a stable, continuous experience of our environment. Research on issues ranging from visual masking to priming across saccades to the representation of spatial layout across views has addressed the issue of what information is preserved from one view to the next. Recently, research on visual memory for objects and scenes has led to striking claims about the nature of the information that is and is not preserved from one instant to the next. For example, studies of change blindness have shown that striking changes to objects and scenes can go undetected when they coincide with an eye movement, a flashed blank screen, a blink, or an occlusion event. These studies suggest that relatively little visual information about objects and scenes is combined across views. Despite these failures of change detection, observers somehow manage to experience a stable, continuous visual environment. This special issue seeks to unite recent studies of change blindness with studies of visual integration to better understand the nature of our representations and the richness of our visual memory.
