Single-Valued Neutrosophic Techniques for Analysis of WIFI Connection Said Broumi, Prem Kumar Singh, Mohamed Talea, Florentin Smarandache, V. Venkateswara Rao, Wireless ad hoc network (WANET) is self-configured networking. It does not rely on pre-existing routers or access points. Mobile ad hoc network (MANET) is an application of WANET where mobile devices are connected wirelessly without any infrastructure. Such networks are either considered as truly connected, not connected and may disconnected due to noise in network or some other uncertainty in connectivity. In this case, characterizing the truth, indeterminacy and falsity information communicated in the mobile network is difficult while utilizing the traditional mathematical set theories. To resolve this issue, in current paper authors' focus on estimating information processing in MANET via mathematics algebra of Single-Valued Neutrosophic Set (SVNS). In addition, an example is given for better understanding of MANET in the neutrosophic environment.
