*In the Hands of Fate* Dwight R Messimer, 2012-04-15 Patrol

Wing Ten was the only U.S. Navy aviation unit to fight the Japanese in the early weeks of World War II, and the daring exploits of its PBY scout-plane pilots offer a dramatic tale of heroism, duty, and controversy. Poorly equipped and dead tired from flying back-to-back patrols with no fighter cover, the men lost sixty-six percent of their aircraft in just eight weeks as they took on an enemy that outnumbered them nearly 1,000 to one. This forceful narrative places the reader right in the midst of their courageous battle. Dwight Messimer's aggressive research on the topic has resulted in a work that provides moving details to their desperate but valiant acts against the seemingly invincible Japanese juggernaut that swept across the southwest Pacific at the opening of the war. By Christmas Day in 1941, Patrol Wing Ten was forced to split into two groups, one fighting an air and sea campaign in Java, the other fighting as infantry on Bataan and Corregidor. Moving back and forth between the two groups, Messimer skillfully interweaves their experiences with the major events of the overall war. He uses material from the fifty survivors he managed to track down and deftly captures their ability to

maintain a sense of humor in the face of overwhelming danger. The more than one hundred personal and official documents uncovered during years of research reveal new information relating to technical points about the planes, facts verified by the PBV crews that do not agree with popularly accepted ideas. To those who believe the wing accomplished nothing--and this group includes many pilots--Messimer argues that while attempts to bomb the Japanese fleet proved futile because the PBVs were unsuitable for such a task, the wing's rescue and evacuation missions saved many lives. The airdales themselves were not so lucky. When Corregidor fell, nearly half of them were captured and many died in captivity.

**The Expendable** John Lewis Floyd,2020 The loss of the Philippine Islands to Japan in 1942 was the greatest military defeat in the history of the United States. The Expendable is the gripping true story of one sailor's struggle to survive this opening battle of WWII in the Pacific. As smoke billows skyward from Pearl Harbor, Japan throws its military might against the outnumbered and under-equipped Filipino forces. When the U.S. Asiatic Fleet flees to the safety of Allied waters, Charles Beckner, a young Navy Corpsman

is left behind, trapped on Bataan with no apparent avenue for escape. -- Back cover.

### **The Dynamics of Right-Wing Extremism within German Society**

Oliver Decker,Johannes Kiess,Elmar Brähler,2022-03-21 The

Dynamics of Right-Wing Extremism within German Society explores the prevalence of right-wing extremist attitudes in Germany. The book provides a thorough psychosocial and sociological theory of general authoritarian dynamics to explain broader societal attitudes, particularly focusing on right-wing extremism. It provides a uniquely long-term perspective on the different dimensions of right-wing extremism—the affinity for dictatorial forms of government, chauvinist attitudes, the trivialisation or justification of National Socialism, anti-Semitism, xenophobia, and social Darwinism. The first chapter delineates the theoretical framework of authoritarian dynamics, while subsequent chapters provide an in-depth analysis of empirical findings and distinguish authoritarian and democratic typologies. The authors focus on recognition of authoritarian statehood and anti-Semitism; the relationship between religion and right-wing extremism; and

support for the radical-right populist party, Alternative für Deutschland (AfD). The innovative theoretical approach of this book scrutinizes the theory of authoritarianism in the contemporary world. This book provides unique empirical data and will be of interest to scholars of German politics, anti-democratic attitudes and prejudices, sociology, political science, and social psychology. **An Introduction to Flapping Wing Aerodynamics Wei**

Shyy,Hikaru Aono,Chang-kwon Kang,Hao Liu,2013-08-19 This is an ideal book for graduate students and researchers interested in the aerodynamics, structural dynamics and flight dynamics of small birds, bats and insects, as well as of micro air vehicles (MAVs), which present some of the richest problems intersecting science and engineering. The agility and spectacular flight performance of natural flyers, thanks to their flexible, deformable wing structures, as well as to outstanding wing, tail and body coordination, is

particularly significant. To design and build MAVs with performance comparable to natural flyers, it is essential that natural flyers' combined flexible structural dynamics and aerodynamics are adequately understood. The primary focus of this book is to address the recent developments in flapping wing aerodynamics. This book extends the work presented in *Aerodynamics of Low Reynolds Number Flyers* (Shyy et al. 2008).

*Flight Investigation of Boundary-layer and Profile-drag Characteristics of Smooth Wing Sections of a P-47D Airplane* John A. Zalovcik, 1945 Summary: A flight investigation was made of boundary-layer and profile-drag characteristics of smooth wing sections of a P-47D airplane. Measurements were made at three stations on the wing: boundary-layer measurements were made on the upper surface of the left wing in the slip-stream at 25 percent semispan; pressure-distribution measurements were made on the upper surface of the left wing at 63 percent semispan; and wake surveys were made at 63 percent semispan of the right wing. The tests were made in straight flight and in turns over a range of conditions in which airplane lift coefficients from 0.15 to 0.68, Reynolds numbers from  $7.7 \times 10^6$  to  $19.7 \times 10^6$ , and Mach numbers from 0.25 to 0.69 were obtained. The results of the

investigation indicated a minimum profile-drag coefficient of 0.0062 for the smooth section at 63 percent semispan. At the highest Mach number attained in the tests, the critical Mach number was exceeded by at least 0.04 with no evidence of compressibility shock losses appearing in the form of increased width of the wake or increased profile-drag coefficient. For flight conditions approaching the critical Mach number, variations in Mach number of as much as 0.17 appeared to have no effect on the profile-drag coefficient. In the slipstream, transition occurred at least as far back as 20 percent chord on the upper surface at low lift coefficients.

*Influence of Large Amounts of Wing Sweep on Stability and Control Problems of Aircraft* Hartley Akin Soule, 1946 The use of large amounts of sweep has been suggested in this country and in Germany as a means of avoiding some of the drag increase and stability and control difficulties encountered in high-speed flight with conventional straight-wing airplanes. Experience with sweep in tailless airplanes and studies made since this suggested has been made have indicated that the use of a large amount of sweep will, in itself, introduce stability and control problems of sufficient magnitude and complexity to require considerable research, particularly for flight at high angles of attack. The paper discusses these problems and, although no proved solutions are given, in some cases promising lines for further investigation are presented.
