Workflow Management Systems for Process Organisations Thomas Schael,2013-11-11 As the business environment has become more and more turbulent over the past decade, information technology has begun to run into the danger of becoming an impediment rather than a motor of progress. In order to deal with the need for rapid, continuous change, computer science is challenged to develop novel interrelated information and communication technologies, and to align them with the social needs of co-operating user groups, as well as the management requirements of formal organisations. Workflow systems are among the most advertised technologies addressing this trend, but they mean different things to different people. Computer scientists understand workflows as a way to extract control from application programs, thus making them more flexible. Bureaucratic organisations (and most commercial products) perceive them as supporting a linear or branching flow of documents from one workplace to another - the next try after the failure of office automation. This book takes another perspective, that of the modern customer-driven and groupwork-oriented process organisation. Extending the language-action perspective from the CSCW field, its customer-oriented view of workflows enables novel kinds of business process analysis, and leads to interesting new combinations of information and co-operation technologies. Schal's empirical studies show some of the pitfalls resulting from a naive use of these technologies, and exemplify ways to get around these pitfalls.

Workflow Management Systems for Process Organisations Thomas Schäl,1998-11-11 This book introduces the perspective of customer-driven and teamwork-oriented process organisation. Its aim is to design and test concepts of Computer Supported Cooperative Work, especially concepts for workflow management systems, in order to fundamentally improve business processes in enterprises. Its methodological approach to analysis and design of cooperative networks is a response to shortcomings of current support systems and misunderstandings about cooperative work and team-based organisations. Several different commercial workflow management systems are presented and distinguished in terms of their main characteristics. Novel kinds of business process analysis are proposed, leading to interesting new combinations of information and cooperation technologies. The book not only presents ways to get around the pitfalls resulting from a naive use of these technologies, but also identifies design guidelines and critical success factors.--PUBLISHER'S WEBSITE.

Workflow Management Systems and Interoperability Asuman Dogac,Leonid Kalinichenko,Tamer Özsu,Amit Sheth,2012-12-06 Workflow management systems (WFMS) are enjoying increasing popularity due to their ability to coordinate and streamline complex organizational processes within organizations of all sizes. Organizational processes are descriptions of an organization's activities engineered to fulfill its mission such as completing a business contract or satisfying a specific customer request. Gaining control of these processes allows an organization to reengineer and improve each process or adapt them to changing requirements. The goal of WFMSs is to manage these organizational processes and coordinate their execution. was demonstrated in the first half The high degree of interest in WFMSs of the 1990s by a significant increase in the number of commercial products (once estimated to about 250) and the estimated market size (in combined \$2 billion in 1996. Ensuing maturity product sales and services) of about is demonstrated by consolidations during the last year. Ranging from mere e-mail based calendar tools and flow charting tools to very sophisticated integrated development environments for distributed enterprise-wide applications and systems to support programming in the large, these products are finding an eager market and opening up important research and development opportunities. In spite of their early success in the market place, however, the current generation of systems can benefit from further research and development, especially for increasingly complex and mission-critical applications.

Modeling and Transformation of Workflows with Temporal Constraints Wolfgang Gruber,2004 Workflow management systems support the execution of

business processes: they require the modeling of the processes, they drive the actual enactment of process instances, and they document the business process execution. Many different modeling languages and systems have been developed for the design and representation of business processes and workflows as a consequence of different requirements, different purposes, as well as different schools and modeling philosophies. The differences are partly on a conceptual level in the sense that the modeling languages offer different concepts and constructs, and partly on the representation level where basically the same constructs are represented differently (e.g. text- or graph-based). This book makes two important contributions to workflow modeling. Firstly, it provides a metamodel based on abstract modeling concepts, which copes with representation differences of workflow descriptions. Secondly, it introduces a set of equivalence transformations on workflow models. Such transformations are an important tool for workflow developments as they allow representing workflows differently for different purposes. These transformations are used in algorithms for checking the satisfiability of temporal constraints in workflow definitions. Using this apparatus made it possible to develop a sophisticated time management system for workflows, which not only checks temporal constraints but can also be used to develop time plans for workflow execution.

Business Process Management Mathias Weske, 2019-06-22 Business process management is usually treated from two different perspectives: business administration and computer science. While business administration professionals tend to consider information technology as a subordinate aspect in business process management for experts to handle, by contrast computer science professionals often consider business goals and organizational regulations as terms that do not deserve much thought but require the appropriate level of abstraction. Matthias Weske argues that all communities involved need to have a common understanding of the different aspects of business process management. To this end, he details the complete business process lifecycle from the modeling phase to process enactment and improvement, taking into account all different stakeholders involved. After starting with a presentation of general foundations and abstraction models, he explains concepts like process orchestrations and choreographies, as well as process properties and data dependencies. Finally, he presents both traditional and advanced business process management architectures, covering, for example, workflow management systems, service-oriented architectures, and data-driven approaches. In addition, he shows how standards like WfMC, SOAP, WSDL, and BPEL fit into the picture. This textbook is ideally suited for classes on business process management, information systems architecture, and workflow management. This 3rd edition contains a new chapter on business decision modelling, covering the Decision Model and Notation (DMN) standard; the chapter on process choreographies has been streamlined, and numerous clarifications have been fetched throughout the book. The accompanying website www.bpm-book.com contains further information and additional teaching material.

ERP and Supply Chain Management Christian Ndubisi Madu, Chu-hua Kuei, 2005-06-10 Businesses today are faced with avalanche of information. There is need to effectively manage information to serve customers better. In today's highly competitive environment, businesses need to be able to organize and coordinate their information so that a single view of information is maintained by all the service channels. Information management can help to understand customers' wants and needs and integrate such in product design. It helps to manage inventory and reduces both cost and the cycle time to introduce new products to the marketplace. Time-to-market is a critical issue in achieving competitiveness and without the availability of timely and accurate information; it

will not be possible to respond proactively to the changing market environment. This book is about ERP and Supply Chain Management. ERP is the short form for Enterprise Resource Planning. The aim of ERP is to integrate the functions of the different business units and departments such as finance, operations, accounting and human resources. This integration is necessary to organize and coordinate information that may be scattered in different departments and making them available in an organized format to the different decision centers where they may be needed. Through this integrative approach, the different functional units of the business are able to share a common database, exchange information, and have consistent view of their operations. This consistent view is also presented to the customer thus improving the quality of customer service. With the integration of the information system, the different functional departments work together to achieve common organizational goals and objectives. Without such integration, common customer services such as order processing would be difficult to track and inconsistent information may be relayed by the different departments to the customer. Supply chain management is an integral aspect of ERP. Businesses today focus on their core competence. It is no longer technically and economically feasible to focus on all activities. Rather, certain activities may be shifted to partners or vendors that have core competence in such areas. Mercedes Benz may find it better to subcontract its radios to Bose while focusing on its car designing. Yet, these two companies may need to share key information on customers' wants and needs as well as information on product designs. Integrating a supplier into the common database helps in providing quality products and services that will satisfy the needs of the customer. Information technology plays a critical role in effective development of ERP system. As many businesses develop online marketplace, it becomes even more important to develop a single view of transactions to all value chain partners including customers, manufacturer, suppliers and other vendors. This book therefore adopts a focus on ERP and Supply Chain Management to develop better plans to better serve the customer. It adopts a management and a systemic perspective of these issues and does not deal with the software aspects of ERP. The focus is on the fundamentals rather than on the advanced issues. The book is intended to help managers, executives, and students to understand the basic concepts of ERP and Supply Chain Management.

The Renaissance of Legacy Systems Ian Warren, 2012-12-06 Many antiquated or legacy systems are still in operation today because they are critical to the organizations continued operations or are prohibitively expensive to replace. This book guides practitioners in managing the process of legacy system evolution. The author introduces a comprehensive method for managing a software evolution project, from its conception to the deployment of the resulting system. The book helps managers answer two critical decisions: What is the best way to evolve a particular legacy system? and How can the legacy system be migrated to a selected target architecture?

Integrated Management of Networked Systems Heinz-Gerd Hegering, Sebastian Abeck, Bernhard Neumair, 1999-08-16 This guide, focusing on the application of standards instead of describing them, is for network and systems planners, managers, administrators and users.

Expert Systems in Chemistry Research Markus C. Hemmer, 2007-12-13 Expert systems allow scientists to access, manage, and apply data and specialized knowledge from various disciplines to their own research. Expert Systems in Chemistry Research explains the general scientific basis and computational principles behind expert systems and demonstrates how they can improve the efficiency of scientific workflows and support decision-making processes. Focused initially on clarifying the fundamental concepts, limits, and drawbacks of using computer software to approach human decision making, the author also underscores the importance of putting theory into practice. The book highlights current capabilities for planning and monitoring experiments, scientific data management and interpretation, chemical characterization, problem solving, and methods for encoding chemical data. It also examines the challenges as well as requirements, strategies, and considerations for implementing expert systems effectively in an existing laboratory software environment. Expert Systems in Chemistry Research covers various artificial intelligence technologies used to support expert systems, including nonlinear statistics, wavelet transforms, artificial neural networks, genetic algorithms, and fuzzy logic. This definitive text provides researchers, scientists, and engineers with a cornerstone resource for developing new applications in chemoinformatics, systems design, and other emerging fields.

Business Process Management (BPM) Bernhard Hitpass, 2014-07-07 Nowadays, an organization is expected to be not only effective and efficient, as it was formerly. Now, in addition, it should be able to adapt to the frequent changes driven by globalization, let us say, be agile. This business agility has become more

important in these times of globalization. The organization that best respond to the fast-changing market, which is becoming increasingly frequent, will have better competitive advantages than those that fail to sustain the pace imposed by globalization. What are the tools that organizations are using to better achieving agility, effectiveness, and efficiency? The answer is more control and efficiency with the ability to manage change in their business processes, because these can create value for customers. BPM is an integrative discipline that comprises management disciplines and techniques. It involves the business layers and technology, including also management through processes, as an integrated whole. The structure of this book consists of two parts. «Part I, Fundamentals of BPM» describe the state of the art of the major BPM theoretical concepts. «Part II, Implementation for BPM» is dedicated to presenting the concepts of implementation, developed largely by the author. This second part considers the technological support in each of the BPM layers. The author shows how to implement the core principles of the discipline, which differs itself from traditional management. This book is for all professionals, whether they perform in the public, private or non-profits sectors who require or want to learn more about this process management discipline. It is also for students and academics of the industrial and computer sciences, and to all the business and administration Schools.

Wide Area Workflow Management Gerold Riempp,2012-12-06 In this volume Gerold Riempp examines the interaction of different workflow management systems (WFMS) in geographically-distributed and legally-separate organisations. This is an emerging field of research known as Wide Area Workflow Management (WAWM). He examines the technical and managerial aspects of workflow management via a framework which he has developed to describe the problems involved in WAWM and to find viable solutions. Based on this theoretical framework, the author also develops a prototype software framework - the Wide Area GroupFlow System - to demonstrate the solutions via practical software tools. The tools will be available to the reader via the WWW. Also included are the results of case studies from some of the 15 developers who have been using this software over the past two years.
