Radio, Submillimeter, and X-Ray Telescopes N. G.

Basov, 2013-12-01 This volume contains the results of research and development connected with the creation of telescopes intended for the new regions of the spectrum mastered by astronomy: the x-ray, submillimeter (far infrared), and radio regions. The creation of x-ray, submillimeter, and radio telescopes and the receiver apparatus connected with them is a complicated and, in many respects, unusual problem. Therefore, the experience accumulated at the Institute of Physics can prove useful to specialists working in this field. This volume is intended for scientists, engineers, and builders occupied in research and development in the fields of x-ray, submillimeter, and radio astronomy as well as for students of advanced courses in these specialties.

Replicate Wolter-I X-Ray Mirrors National Aeronautics and Space Administration, 2018-12-29 Cylindrical (hyperbolic - parabolic Wolter I) mirrors have been electroformed from nickel over an electroless nickel-phosphorous (NiP) plated aluminum mandrel in support of the NASA AXAF-S x-ray spectrometer program. The electroless nickel was diamond turned and polished to achieve a surface finish of 10 angstroms rms or better. Gold was then plated on the nickel alloy after an electrochemical passivation step. Next a heavy layer of pure nickel was plated one millimeter thick with controlled stress at zero using a commercial PID

program to form the actual mirror. This shell was removed from the NiP alloy coated mandrel by cryogenic cooling and contraction of the aluminum to release the mirror. It is required that the gold not adhere well to the NiP but all other plated coatings must exhibit good adherence. Four mirrors were fabricated from two mandrels prepared by this method. The area of each part is 0.7 square meters (7.5 square feet). Engelhaupt, D. E. and Rood, R. and Fawcett, S. and Griffith, C. and Khanijow, R. Forming Mandrels for X-Ray Mirror Substrates Peter N. Blake, Nasa Technical Reports Server (Ntrs), Et Al, 2013-06 Precision forming mandrels are one element in X-ray mirror development at NASA. Current mandrel fabrication process is capable of meeting the allocated precision requirements for a 5 arcsec telescope. A manufacturing plan is outlined for a large

IXO-scale program.

Grazing Incidence Wavefront Sensing and Verification of X-Ray Optics Performance Timo T. Saha, Nasa Technical Reports Server (Ntrs), Et Al, 2013-06 Evaluation of interferometrically measured mirror metrology data and characterization of a telescope wavefront can be powerful tools in understanding of image characteristics of an x-ray optical system. In the development of soft x-ray telescope for the International X-Ray Observatory (IXO), we have developed new approaches to support the telescope development process. Interferometrically measuring the optical components over all relevant spatial frequencies can be used to evaluate and predict the performance of an x-ray telescope. Typically, the mirrors are measured using a mount that minimizes the mount and gravity induced errors. In the assembly and mounting process the shape of the mirror segments can dramatically change. We have developed wavefront sensing techniques suitable for the x-ray optical components to aid us in the characterization and evaluation of these changes. Hartmann sensing of a telescope and its components is a simple method that can be used to evaluate low order mirror surface errors and alignment errors. Phase retrieval techniques can also be used to assess and estimate the low order axial errors of the primary and secondary mirror segments. In this paper we describe the mathematical foundation of our Hartmann and phase retrieval sensing techniques. We show how these techniques can be used in the evaluation and performance prediction process of x-ray telescopes.

High Resolution X-Ray Explorer (Hirex) National Aeronautics and Space Administration, 2018-12-31 SAO is involved in a study to determine the feasibility of building an orbiting telescope capable of resolving 7 km structure on the Sun. In order to achieve the required imaging the telescope must have a resolution 0.01 arcsec. This fact challenges the state of the art of orbiting

telescopes in several areas: Mirror Figuring; Optical Metrology; Optical Mounting; Mirror Figure Control; System Alignment; Optical Stability; Observatory Pointing; and Image Stability. The telescope design concept is based on a 0.6 m Gregorian-style telescope with a 240 meter effective focal length. This is achieved with 2 mirrors supported at opposite ends of a 35 m space-deployable boom. The telescope mirrors are coated with multilayers designed to reflect a broad XUV passband. A third, small mirror, near the focal plane performs the function of selecting the narrow band that is finally imaged. Image stabilization to the 0.005 arcsec level is achieved by active control of the secondary mirror. The primary mirror is held unadjustably to the spacecraft, its pointing set by the spacecraft orientation. The secondary mirror is mounted on a 6-axis stage that permits its position to be changed to align the telescope in space. The stage is intended for intermittent adjustment, both because of its speed of travel, and the TBD alignment procedure. The third mirror is called the TXI (Tuneable X-ray Imager). It is mounted on a gimbal that permits it to be tipped over a 60 degree range, selecting between the individual wavelengths in the initial bandpass. It can also rotated completely out of the way to allow the full, broadband EUV flux to strike the focal plane. Finally, the focal plane assembly is designed to rotate on the outer edge of a circle centered on the TXI mirror rotation axis. This permits the focal plane to move to the location that the TXI redirects the light once it has been set to a given wavelength response. The Engineering Study is divided into the following areas: Mirror Fabrica...

Gratings, Mirrors and Slits WB Peatman, 2017 Intended to provide scientists and engineers at synchrotron radiation facilities with a sound and convenient basis for designing beamlines for monochromatic soft x-ray radiation, this text will also be helpful to the users of synchrotron radiation who want to help ensure that beamlines being built are optimized for the experiments to be performed on them. The primary purpose of a beamline is to capture as much of the light of the source as possible and then to transfer the desired portion of that light as completely as possible to the experiment. With the development of dedicated, brilliant synchrotron radiation sources, the first half of the task has been greatly simplified. The beamline designer must contend with the second half of the problem -- conserving the brilliance of the source through an optical system which monochromatizes and focuses the radiation.--Provided by publisher.

The Mirror Marlys Millhiser, 2015-05-05 In this twisting time-travel thriller, a woman faints on the eve of her wedding—and awakens at the turn of the century in her grandmother's body . . . The night before she is supposed to get married, Shay Garrett has no idea that a glimpse into her grandmother's antique Chinese mirror will completely transform her seemingly ordinary life. But after a bizarre blackout, she wakes up to find herself in the same house—but in the year 1900. Even stranger, she realizes she is now living in the body of her grandmother, Brandy McCabe, as a young woman. Meanwhile, Brandy, having looked into the same mirror, awakens in Shay's body in the present day—and discovers herself pregnant. As Rachael—the woman who links these two generations, mother to one and daughter to another—weaves back and forth between two time periods, this imaginative thriller explores questions of family, identity, and love. Courageous, compassionate Shay finds herself fighting against the confines of a society still decades away from women's liberation, while

Brandy struggles to adapt to the modern world she has suddenly been thrust into. The truth behind this inexplicable turn of events is more complex than either woman can imagine—and *The Mirror* is a tribute to the triumph of the female spirit, even in the face of seemingly insurmountable obstacles. “What happens will surprise you. In the meantime, settle down for a good read.” —The Denver Post

The Universe in a Mirror Robert Zimmerman, 2008 The Hubble Space Telescope has produced the most stunning images of the cosmos humanity has ever seen. This book tells the story of this telescope and the visionaries responsible for its extraordinary accomplishments. Elliptical Mirrors Jian Liu, 2018-10-15 Composed by a specialist in the field, Professor Jian Liu and with the members of his team contributing to the work, *Elliptical Mirrors* discusses the importance of the elliptical mirror, the third solution in far field optical imaging after parabolic reflectors and lenses for which apodization factors were established in 1921 and 1959 respectively. Elliptical Mirrors are a new and novel technique within the world of optics and can be applied to industrial imaging, bio-imaging, x-ray photography and much more. Elliptical mirrors are inevitably going to retain a significant role in trend of microscopic development. This detailed and highly insightful book will be an important insight into a growing subject area that will benefit PhD students, optical physicists, metrologists and researchers who have an interest in the ever-growing science of optics. The book discusses the original

concept of elliptical mirrors and gives a fundamental and comprehensive theory behind them and their functions.
