**Soils** Randall J. Schaetzl, Sharon Anderson, 2005-05-05 Soils: Genesis and Geomorphology is a comprehensive and accessible textbook on all aspects of soils. The book's introductory chapters on soil morphology, physics, mineralogy and organisms prepare the reader for the more advanced and thorough treatment that follows. Theory and processes of soil genesis and geomorphology form the backbone of the book, rather than the emphasis on soil classification that permeates other less imaginative soils textbooks. This refreshingly readable text takes a truly global perspective, with many examples from around the world sprinkled throughout. Replete with hundreds of high quality figures and a large glossary, this book will be invaluable for anyone studying soils, landforms and landscape change. Soils: Genesis and Geomorphology is an ideal textbook for mid- to upper-level undergraduate and graduate level courses in soils, pedology and geomorphology. It will also be an invaluable reference text for researchers.

Progress in Reaction Kinetics G. Porter, 2013-09-03 Progress in Reaction Kinetics, Volume 4 is a 10-chapter text that focuses on the reactions of nitrogen atoms in the gas phase and some chemical factors in the kinetics of processes at electrodes. This volume describes first the free radical reactions dealing with halogenomethyl and alkoxyl radicals. The next chapters deal with electronically excited states, proton transfer, and kinetics of electrode processes. These topics are followed by discussions on the primary processes in the gas phase photochemistry of carbonyl compounds, as well as the mechanisms and rates of radiationless energy transfer. This book also looks into the methods used for the measurement of fluorescence lifetimes of aromatic compounds. A chapter examines the chemiluminescence in the oxidation of organic compounds and for other liquid-phase reactions. The last chapters discuss the role of the solvent in proton transfer reactions and some aspects of developments in the field of electrode processes. This book is of great value to reaction kinetics scientists and researchers.

**NIPP1, an Interactor of Protein Phosphatase-1, Displays Endoribonuclease and Transcriptional Repression Activities** Qiming Jin, 2004 This is a Ph.D. dissertation. This thesis deals with the eukaryotic protein NIPP1 (Nuclear Inhibitor of Protein Phosphate-1), which was initially described by the host laboratory in 1992 and still is the major focus of its research efforts. The first part of the introduction describes our current insights into the structure and function of NIPP1, with the exception of aspects that directly deal with this doctoral project. For reasons of clarity, the data are presented in a logical manner, which implies that they are not necessarily presented according to their order of discovery. In the final sections of the introduction, a brief overview will be given of the state of the art of the 'structure and function of ribonucleases' and 'transcriptional repression mechanisms,' two topics that directly related to this research project. Contents include: Introduction, The Structure and Function of NIPP1, The Structure and Function of Ribonucleases, Transcriptional Repression in Eukaryotes, Aims and Strategies, Materials and Methods, Results and Discussions, Mapping of the RNA-binding and Endoribonuclease Domain of NIPP1, Screening for Proteins that Interact with the C-Terminal domain of NIPP1.

**Progress in Low Temperature Physics** ,1991-12-17 Since 1955 Progress in Low Temperature Physics has continued to monitor scientific achievements in the realm of low-temperature physics. Obtaining low temperatures used to be an aim in itself in the past, whereas nowadays achieving millikelvin temperatures is a routine experimental procedure. However, the properties of materials at these low temperatures continue to produce fascinating physics: the liquid, solid and superfluid, phases of the quantum fluids <sup>3</sup>He and <sup>4</sup>He as well as 'new' materials such as high-temperature superconductors and tiny quantum devices display their macroscopic quantum behavior only at the lowest temperatures. Volume XIII of this series continues the tradition of collecting fundamental studies of macroscopic quantum phenomena. In this volume, properties of new systems such as small circuits at low temperatures and high-T<sub>c</sub> superconductors are studied. But the systems that are formed by <sup>3</sup>He and <sup>4</sup>He and their mixtures at low temperatures continue to dazzle and amaze with their ever more intricate properties studied with increasing accuracy. This volume provides the reader with an archival overview of the magic world of low temperatures as perceived by today's most sensitive probes.
