Health Data in the Information Age Institute of Medicine, Committee on Regional Health Data Networks, 1994-01-01 Regional health care databases are being established around the country with the goal of providing timely and useful information to policymakers, physicians, and patients. But their emergence is raising important and sometimes controversial questions about the collection, quality, and appropriate use of health care data. Based on experience with databases now in operation and in development, *Health Data in the Information Age* provides a clear set of guidelines and principles for exploiting the potential benefits of aggregated health data—without jeopardizing confidentiality. A

panel of experts identifies characteristics of emerging health database organizations (HDOs). The committee explores how HDOs can maintain the quality of their data, what policies and practices they should adopt, how they can prepare for linkages with computer-based patient records, and how diverse groups from researchers to health care administrators might use aggregated data. Health Data in the Information Age offers frank analysis and guidelines that will be invaluable to anyone interested in the operation of health care databases.

Improving Health in the Community Institute of Medicine, Committee on Using Performance Monitoring to Improve Community Health, 1997-04-21 How do communities protect and improve the health of their populations? Health care is part of the answer but so are environmental protections, social and educational services, adequate nutrition, and a host of other activities. With concern over funding constraints, making sure such activities are efficient and effective is becoming a high priority. *Improving Health in the Community* explains how population-based performance monitoring programs can help communities point their efforts in the right direction. Within a broad definition of community

health, the committee addresses factors surrounding the implementation of performance monitoring and explores the why and how to of establishing mechanisms to monitor the performance of those who can influence community health. The book offers a policy framework, applies a multidimensional model of the determinants of health, and provides sets of prototype performance indicators for specific health issues. Improving Health in the Community presents an attainable vision of a process that can achieve community-wide health benefits.

Health Performance Measurement in the Public Sector National Research Council, Division of Behavioral and Social Sciences and Education, Commission on Behavioral and Social Sciences and Education, Panel on Performance Measures and Data for Public Health Performance Partnership Grants, 1999-03-31 There is growing interest in using performance measurement as a means of holding federal, state, and local health agencies accountable for their use of public funds. *Health Performance Measurement in the Public Sector* is the second of two books for the U.S. Department of Health and Human Services on using and improving performance measurement in publicly funded

health programs and the implications for data needs and systems. This book focuses on data and information system issues at the federal, state, and local levels. Recommendations address: Policy framework for selecting performance measures and using performance measurement. Operational principles related to data and data systems that support performance measurement. Essential investments in data systems and in training and technical assistance. Handbook of Life Course Health Development Neal Halfon, Christopher B Forrest, Richard M Lerner, 2020-10-08 This handbook synthesizes and analyzes the growing knowledge base on life course health development (LCHD) from the prenatal period through emerging adulthood, with implications for clinical practice and public health. It presents LCHD as an innovative field with a sound theoretical framework for understanding wellness and disease from a lifespan perspective, replacing previous medical, biopsychosocial, and early genomic models of health. Interdisciplinary chapters discuss major health concerns (diabetes, obesity), important less-studied conditions (hearing, kidney

health), and large-scale issues (nutrition, adversity) from a lifespan viewpoint. In addition, chapters address methodological approaches and challenges by analyzing existing measures, studies, and surveys. The book concludes with the editors' research agenda that proposes priorities for future LCHD research and its application to health care practice and health policy. Requirements Engineering for Digital Health Samuel A. Fricker, Christoph Thümmel, Anastasius Gavras, 2016-09-22 Healthcare and well-being have captured the attention of established software companies, start-ups, and investors. Software is starting to play a central role for addressing the problems of the aging society and the escalating cost of healthcare services. Enablers of such digital health are a growing number of sensors for sensing the human body and communication infrastructure for remote meetings, data sharing, and messaging. The challenge that lies in front of us is how to

effectively make use of these capabilities, for example to empower patients and to free the scarce resources of medical personnel. Requirements engineering is the process by which the capabilities of a software product are aligned with stakeholder needs and a shared understanding between the stakeholders and development team established. This book provides guide for what to look for and do when inquiring and specifying software that targets healthcare and well-being, helping readers avoid the pitfalls of the highly regulated and sensible healthcare domain and how they can be overcome. This book brings together the knowledge of 22 researchers, engineers, lawyers, and CEOs that have experience in the development of digital health solutions. It represents a unique line-up of best practices and recommendations of how to engineer requirements for digital health. In particular the book presents:

- The area of digital health, e-health, and m-health
- Best practice for requirements engineering based on evidence from a large number of projects
- Practical step-by-step guidelines, examples, and lessons-learned for working with laws, regulations, ethical issues, interoperability, user experience, security, and privacy
- How to put these many concerns together for engineering the

requirements of a digital health solution and for scaling a digital health product For anybody who intends to develop software for digital health, this book is an introduction and reference with a wealth of actionable insights. For students interested in understanding how to apply software to healthcare, the text introduces key topics and guides further studies with references to important literature.

Rethinking Development and Health Sean McKee, 2016 A worldwide collaborative effort to measure the impact of health problems on people, the Global Burden of Diseases, Injuries, and Risk Factors Study (GBD) is coordinated by the Institute for Health Metrics and Evaluation at the University of Washington in Seattle. Data for the project are collected and analyzed by 1,870 collaborators from 124 countries and three territories. GBD uncovers the toll of early death and disability caused by more than 300 diseases and injuries in 195 countries and territories from 1990 to the present. Its methods and metrics emphasize comparability among causes that kill and causes that disable. The GBD is frequently updated using new data to improve past and present estimates of disease burden. The GBD 2015 study shows that, from 1990 to 2015, the world as a whole has been undergoing an

epidemiological transition. The nature of that transition is discussed in this document in a brief overview of some key GBD 2015 results.
