Access Controlled Ronald Deibert,John Palfrey,Rafal Rohozinski,Jonathan Zittrain,2010-04-02 Reports on a new generation of Internet controls that establish a new normative terrain in which surveillance and censorship are routine. Internet filtering, censorship of Web content, and online surveillance are increasing in scale, scope, and sophistication around the world, in democratic countries as well as in authoritarian states. The first generation of Internet controls consisted largely of building firewalls at key Internet gateways; China's famous "Great Firewall of China" is one of the first national Internet filtering systems. Today the new tools for Internet controls that are emerging go beyond mere denial of information. These new techniques, which aim to normalize (or even legalize) Internet control, include targeted viruses and the strategically timed deployment of distributed denial-of-service (DDoS) attacks, surveillance at key points of the Internet's infrastructure, take-down notices, stringent terms of usage policies, and national information shaping strategies. Access Controlled reports on this new normative terrain. The book, a project from the OpenNet Initiative (ONI), a collaboration of the Citizen Lab at the University of Toronto's Munk Centre for International Studies,

Harvard's Berkman Center for Internet and Society, and the SecDev Group, offers six substantial chapters that analyze Internet control in both Western and Eastern Europe and a section of shorter regional reports and country profiles drawn from material gathered by the ONI around the world through a combination of technical interrogation and field research methods.

   The History of Information Security Karl Maria Michael de Leeuw,Jan Bergstra,2007-08-28

Information Security is usually achieved through a mix of technical, organizational and legal measures.

These may include the application of cryptography, the hierarchical modeling of organizations in order

to assure confidentiality, or the distribution of accountability and responsibility by law, among interested

parties. The history of Information Security reaches back to ancient times and starts with the

emergence of bureaucracy in administration and warfare. Some aspects, such as the interception of

encrypted messages during World War II, have attracted huge attention, whereas other aspects have

remained largely uncovered. There has never been any effort to write a comprehensive history. This is

most unfortunate, because Information Security should be perceived as a set of communicating

vessels, where technical innovations can make existing legal or organisational frame-works obsolete and a breakdown of political authority may cause an exclusive reliance on technical means. This book is intended as a first field-survey. It consists of twenty-eight contributions, written by experts in such diverse fields as computer science, law, or history and political science, dealing with episodes, organisations and technical developments that may considered to be exemplary or have played a key role in the development of this field. These include: the emergence of cryptology as a discipline during the Renaissance, the Black Chambers in 18th century Europe, the breaking of German military codes during World War II, the histories of the NSA and its Soviet counterparts and contemporary cryptology. Other subjects are: computer security standards, viruses and worms on the Internet, computer transparency and free software, computer crime, export regulations for encryption software and the privacy debate. - Interdisciplinary coverage of the history Information Security - Written by top experts in law, history, computer and information science - First comprehensive work in Information Security

Protecting Europe against large-scale cyber attacks Great Britain: Parliament: House of Lords: European Union Committee,2010-03-18 The issue of large-scale cyber-attacks on the internet has moved up the international agenda recently. This inquiry looks at how States and their major organisations can defend themselves and their critical information infrastructures (CIIs) against such attacks. Whilst individual States bear primary responsibility for their critical national infrastructure (CNI), the infrastructures are heavily interdependent. The Internet is a 'global network of networks' and individual States cannot be viewed in isolation. The Committee therefore concludes that continuing intervention at EU level was appropriate and that all Member States have an interest in bringing the defences of the least protected up. The Committee also looked at ENISA, the European Network and Information Security Agency, and they believe that with a widening of its mandate it can play a more significant part in the developments envisaged.
