Electronic Information Systems in Sci-Tech Libraries Cynthia A. Steinke,2019-12-06 This book, first published in 1990, analyses the variety of ways in which libraries extend their resources to users beyond the physical walls of their organization. Librarians discuss the concept of the library as more than just a place – since its holdings can now appear on the screen of users' computers in the same city or in a city hundreds of miles away – but rather as a force that electronically links users directly with both local and remote sources of information. Six informative chapters examine electronic information systems and document delivery from the local collection to the workplace, between system libraries and from non-library sources. Readers can look first hand at some of the most sophisticated and widespread systems in the country, including four academic libraries that promote electronic services to remote users and two special libraries offering innovative services. The authoritative contributing authors also forecast new systems and services.

Instruction for Information Access in Sci-tech Libraries Cynthia A. Steinke,1993 This helpful guide describes instructional service programs at nine sci-tech libraries to illustrate ideas and methods that work. The continued proliferation of information resources and exploding advances in technology have brought dramatic changes to the role of the reference/instruction librarian. These librarians are striving to develop services that focus on strategies and critical thinking, ensure interactive instruction at various levels of user skill, involve faculty and computer center staff, and provide easy-to-use techniques that are self-directed and lead to success. Instruction for Information Access in Sci-Tech Libraries helps readers resolve these issues and illustrates effective, proven strategies to help teach faculty, staff, and students how to do effective research and get the information they need. Authors from institutions around the country discuss educational programs that they have found successful. Informative chapters describe: a joint library/computer center cooperative program a bibliographic instruction program to prepare geology students with information skills necessary for professional careers a course designed to create informed end-users of the electronic life sciences literature the integration of information skills throughout two years of a curriculum for wildlife technology students a three-level course-integrated approach for chemistry students a cooperative end-user training program to provide campus-wide access to LEXIS/NEXIS the use of roleplaying in bibliographic instruction objectives and components of bibliographic instruction in the special library Professionals will find Instruction for Information Access in Sci-Tech Libraries full of helpful ideas and suggestions for restructuring old programs or developing new ones to help students and other users of library services learn how to seek and gather information effectively.

Enhancing Access to Information David A. Tyckoson,1991 Enhancing Access to Information addresses the problem when a library has limited catalog access. It discusses the various technological possibilities to help the cataloger once again cover the entire collection with his system. For centuries, the catalog has served as the primary access point to the information sources of a particular library. The principal role of the catalog has been to index and describe the information contained within the library's collection. However, despite all of the advancements in modern technology, today's library catalog system tends to index only a very small percentage of the library's comprehensive collection. The ability to expand the catalog beyond its traditional boundaries is now within our grasp, and this volume explores several ways to do it. The chapters cover a wide range of methods for improving access to information by building upon the existing catalog. Topics covered include enhancing access to existing records, adding databases for materials not traditionally included in the catalog, improving search software, enhancing the user interface, and linking a diverse array of library systems. Several reports come from libraries that have already taken the initial steps toward reclaiming the role of the catalog as the complete index to the collection. This inspiring book encourages others to explore new ways of improving access through the catalog.

Insider's Guide to Library Automation John W. Head,Gerard B. McCabe,1993-05-18 Libraries are becoming increasingly automated. Many libraries have already become automated, and librarians have had to confront a new set of problems in their jobs. Many other libraries are not yet automated, but will soon be acquiring new technology and new problems. This book provides detailed techniques for coping with the problems inherent in automation. While other works offer thorough coverage of the library automation process, this volume provides case studies of the personal experiences of librarians who have had to solve problems related to automation. Included are case studies from large academic libraries, special libraries, public libraries, and smaller libraries. The first section of the book includes chapters on locally developed library automation systems and how those systems have adapted to change. The second section contains chapters on selecting, buying, and installing automation systems. The third section includes chapters on the sharing of automated systems by different libraries. The fourth section, on database maintenance and conversion, contains chapters important to all librarians. The fifth section discusses the management of automated systems. The book concludes with a bibliographic essay that overviews developments in library automation technology and lists sources for further information.
