Technology and Agribusiness Victor Grimblatt, 2022-09-01 The world population is growing, and it is expected that in 2050 there will be 9.7 billion inhabitants on the Earth. According to FAO (United Nations, Food and Agriculture Organization) we need to increase the productivity of agriculture by between 50% and 70% to be able to feed the world population in 2050. Other researchers think that reducing the wastage of food may be enough to handle the 2050 population. Several factors must be considered to ensure that humanity is able to feed the world's population in 2050 and beyond. • Less arable land: As cities are growing, the space available for agriculture is shrinking. • Climate change: Dramatic impacts on agribusiness. • Role of agribusiness on GHG emissions. • Planetary boundaries and the role of agribusiness. • Availability of freshwater. • Soil degradation. The seasonal school presents and discusses the major problems that agribusiness is facing and the different technologies that can be applied to solve and improve such issues. Specific case studies are presented along with the technological solutions that have been applied to solve or minimize the impact. Agribusiness covers different topics such as arable farming, dairy farming, fruits, vegetables, meat, etc. Each of these domains has different needs that can be addressed through smart agriculture technologies such as circuits and systems. Also, these domains affect the sustainability of the planet as they impact at least 4 out of the 9 planetary boundaries.

Agricultural Internet of Things Yong He, Pengcheng Nie, Qin Zhang, Fei Liu, 2021-08-02 Internet of things (IoT) is a new type of network that combines communication technology, expanded applications, and physical devices. Among them, agriculture is one of the most important areas in the application of the IoT technology, which has its unique requirements and integration features. Compared to the information technology in traditional agriculture, the agricultural IoT mainly refers to industrialized production and sustainable development under relatively controllable conditions. Agricultural IoT applies sensors, RFID, visual capture terminals and other types of sensing devices to detect and collect site information, and with broad applications in field planting, facility horticulture, livestock and poultry breeding, aquaculture and agricultural product logistics. It utilizes multiple information transmission channels such as wireless sensor networks, telecommunications networks and the internet to achieve reliable transmission of agricultural information at multiple scales and intelligently processes the acquired, massive information. The goals are to achieve (i) optimal control of agricultural production process, (ii) intelligent electronic trading of agricultural products circulation, and (iii) management of systematic logistics, quality and safety traceability. This book focuses on three levels of agricultural IoT network: information perception technology, information transmission technology and application technology.

Information and Communication Technologies for Agriculture—Theme IV: Actions Dionysis D. Bochtis, Simon Pearson, Maria Lampridi, Vasso Marinoudi, Panos M. Pardalos, 2022-03-08 This volume is the last (IV) of four under the main themes of Digitizing Agriculture and Information and Communication Technologies (ICT). The four volumes cover rapidly developing processes including Sensors (I), Data (II), Decision (III), and Actions (IV). Volumes are related to 'digital transformation' within agricultural production and provision systems, and in the context of Smart Farming Technology and Knowledge-based Agriculture. Content spans broadly from data mining and visualization to big data analytics and decision making, alongside with the sustainability aspects stemming from the digital transformation of farming. The four volumes comprise the outcome of the 12th EFITA Congress, also incorporating chapters that originated from select presentations of the Congress. The focus in this volume is on the directions of Agriculture 4.0 which incorporates the transition to a new era of action in the Agricultural sector, represented by the evolution of digital technologies in 4 aspects: Big Data, Open Data, Internet of Things (IoT), and Cloud Computing. Under the heading of "Action," 14 Chapters investigate the implementation of cutting-edge technologies on real world applications. It will become apparent to the reader that the penetration of ICT in agriculture can result in several benefits related to the sustainability of the sector and to yield the maximum benefits, successful management is required. The entire discussion highlights the importance of proper education in the adoption of innovative technologies starting with the adaption of educational systems to the new era and moving to the familiarization of farmers to the new technologies. This book covers topics that relate to the digital transformation of farming. It provides examples and case studies of this transformation from around the world, examines the process of diffusion of digital technologies, and assesses the current and future sustainability aspects of digital agriculture. More specifically, it deals with issues such as: Challenges and opportunities from the transition to Agriculture 4.0 Safety and health in agricultural work automation The role of digital farming on regional-spatial planning The enrollment of Social Media in IoT-based agriculture The role of education in digital agriculture Real-life implementation cases of smart agriculture around the world

Forthcoming Books Rose Arny,1990

A Public Health Perspective on End of Life Care Joachim Cohen,Luc Deliens,2012-01-19 Worldwide, more than 50 million people die each year and it is estimated on the basis of the conditions leading to death that up to 60% of them could benefit from some form of palliative care. It is a public health challenge to ensure that these people can access good palliative or end-of-life care. Pursuing good population health essentially also implies striving for a 'good enough death' and a good quality of care at the end of life. Safeguarding a good quality of the end of life for patient populations for whom it is appropriate requires a public health approach. In most developed countries ageing populations that increasingly die from chronic diseases after a prolonged -often degenerative- dying trajectory make up the public health challenges for palliative care. The very large baby boom generation will soon reach old age and can be expected to pose strong demands regarding the circumstances and care at their end of life. Only by applying a public health approach to palliative care (instead of individual patient perspectives), can societies successfully help to organize and plan end-of-life care in accordance with these aspirations. A Public Health Perspective on End of Life Care presents a synthesis and overview of relevant research and empirical data on the end of life that can bear a basis for a more systematic 'public health of the end of life'. The book focuses on population health, rather than clinical interventions or other aspects of individual health, and discusses studies using different methodologies (not only epidemiological research). The focus is on the quality of the end-of-life of populations, in particular from social sciences, environmental sciences, and humanities perspectives.
