New Trends in Software Process Modeling Silvia T. Acuna,Maria Isabel Sa ?nchez-Segura,2006 Over the years, a variety of software process models have been designed to structure, describe and prescribe the software systems construction process. More recently, software process modelling is increasingly dealing with new challenges raised by the tests that the software industry has to face. This book addresses these new trends in software process modeling related to: . OCo Processes for open source software;. OCo Systems dynamics to model and simulate the software process;. OCo Peopleware: the importance of people in the software development and by extension in the software process. One new software development trend is the development of open source projects. As such projects are a recent creation, the process model governing this type of developments is unfamiliar. This book deals with process modeling for open source software. It also deals with software process simulation applied to the management of software projects and improves the software development process capability according to CMM (Capability Maturity Model). Software development is a conjunction of: the organizational environment, the social environment and the technological environment. The inclusion of these environments will make it possible to output software process models that meet the specified organizational, cultural and technological requirements, providing an exhaustive analysis of the people in the software process, as well as supporting people-oriented software development. This book deals with the development of software by means of people-oriented process models that have proven to be very beneficial. Sample Chapter(s). Chapter 1: Discovering, Modeling, and Re-Enacting Open Source Software Development Processes: A Case Study (316 KB). Contents: Discovering, Modeling, and Re-enacting Open Source Software Development Processes: A Case Study (C Jensen & W Scacchi); Software Process Dynamics: Modeling, Simulation and Improvement (M Ruiz et al.); Software Process Simulation with System Dynamics OCo A Tool for Learning and Decision Support (D Pfahl et al.); High Level Software Project Modeling with System Dynamics (M De Oliveira Barros et al.); People-Oriented Capture, Display, and Use of Process Information (J Heidrich et al.); Requirements and Validation of the E3 Process Modeling System (L Jaccheri). Readership: Researchers, students and professionals of software process and development.

Mind your business Theo Vorster,2013-11-01 Mind your Business is a compilation of the success stories of prominent South African businesspeople, from entrepreneurs to

chief executives of multinational business giants. This book is the outgrowth of South African channel kykNet's popular TV series Sakegesprek met Theo Vorster. After many inquiries from viewers, Theo decided to summarise his 38 interviews from the show in book form and to share these informative and inspiring conversations with readers. Each chapter tells the story of a business leader's personal journey to success, including the setbacks and obstacles that had to be overcome. Theo explains key principles and offers some of his own observations about his interaction with the business people. This book is intended for anyone who is interested in the success stories of business leaders and would like to apply some of the key principles in their own enterprises or careers.

Building Automated Trading Systems Benjamin Van Vliet, 2007-03-07 Over the next few years, the proprietary trading and hedge fund industries will migrate largely to automated trade selection and execution systems. Indeed, this is already happening. While several finance books provide C++ code for pricing derivatives and performing numerical calculations, none approaches the topic from a system design perspective. This book will be divided into two sections—programming techniques and automated trading system (ATS) technology—and teach financial system design and development from the absolute ground up using Microsoft Visual C++.NET 2005. MS Visual C++.NET 2005 has been chosen as the implementation language primarily because most trading firms and large banks have developed and continue to develop their proprietary algorithms in ISO C++ and Visual C++.NET provides the greatest flexibility for incorporating these legacy algorithms into working systems. Furthermore, the .NET Framework and development environment provide the best libraries and tools for rapid development of trading systems. The first section of the book explains Visual C++.NET 2005 in detail and focuses on the required programming knowledge for automated trading system development, including object oriented design, delegates and events, enumerations, random number generation, timing and timer objects, and data management with STL.NET and .NET collections. Furthermore, since most legacy code and modeling code in the financial markets is done in ISO C++, this book looks in depth at several advanced topics relating to managed/unmanaged/COM memory management and interoperability. Further, this book provides dozens of examples illustrating the use of database connectivity with ADO.NET and an extensive treatment of SQL and FIX and XML/FIXML. Advanced programming topics such as threading, sockets, as well as using C++.NET to connect to Excel are also discussed at length and supported by examples. The second section of the book explains technological concerns and design concepts for automated trading systems. Specifically, chapters are devoted to handling real-time data feeds, managing orders in the exchange order book, position selection, and risk management. A .dll is included in the book that will emulate connection to a widely used industry API (Trading Technologies, Inc.'s XTAPI) and provide ways to test position and order management algorithms. Design patterns are presented for market taking systems based upon technical analysis as well as for market making systems using intermarket spreads. As all of the chapters revolve around computer programming for financial engineering and trading system development, this book will educate traders, financial engineers, quantitative analysts, students of quantitative finance and even experienced programmers on technological issues that revolve around development of financial applications in a Microsoft environment and the construction and implementation of real-time trading systems and tools. * Teaches financial system design and development from the ground up using Microsoft Visual C++.NET 2005. * Provides dozens of examples illustrating the programming approaches in the book * Chapters are supported by screenshots, equations, sample Excel spreadsheets, and programming code

Economics of Advanced Manufacturing Systems Hamid R. Parsaei,A.

Mital,2012-12-06 The 1980s have witnessed a tremendous growth in the field of computer integrated manufacturing systems. The other major areas of development have been computer-aided design, computer-aided manufacturing, industrial robotics, automated assembly, cellular and modular material handling, computer networking and office automation to name just a few. These new technologies are generally capital intensive and do not conform to traditional cost structures. The net result is a tremendous change in the way costs should be estimated and economic analyses performed. The majority of existing engineering economy texts still profess application of traditional analysis methods. But, as was mentioned above, it is clear that the basic trend in manufacturing industries is itself changing. So it is quite obvious that the practice of traditional economic analysis methods should change too. This book is an attempt to address the various issues associated with non-traditional methods for evaluation of advanced computer-integrated technologies. This volume consists of twenty refereed articles which are grouped into five parts. Part one, Economic Justification Methods, consists of six articles. In the first paper, Soni et al. present a new classification for economic justification methods for advanced automated manufacturing systems. In the second, Henghold and LeClair look at strengths and weaknesses of expert systems in general and more specifically, an application aimed at investment justification in advanced technology. The third paper, by Carrasco and Lee, proposes an enhanced economic methodology to improve the needs analysis, conceptual design and detailed design activities associated with technology modernization.
