**Quantum Theory and Symmetries with Lie Theory
and Its Applications in Physics Volume 1** Vladimir
Dobrev,2018-11-28 This book is the first volume of
proceedings from the joint conference X
International Symposium “Quantum Theory and
Symmetries” (QTS-X) and XII International Workshop
“Lie Theory and Its Applications in Physics” (LT-
XII), held on 19–25 June 2017 in Varna, Bulgaria.
The QTS series was founded on the core principle
that symmetries underlie all descriptions of
quantum systems. It has since evolved into a
symposium at the forefront of theoretical and
mathematical physics. The LT series covers the
whole field of Lie theory in its widest sense,
together with its applications in many areas of
physics. As an interface between mathematics and
physics, the workshop serves as a meeting place
for mathematicians and theoretical and
mathematical physicists. In dividing the material
between the two volumes, the Editor has sought to
select papers that are more oriented toward
mathematics for the first volume, and those
focusing more on physics for the second. However,
this division is relative, since many papers are
equally suitable for either volume. The topics
addressed in this volume represent the latest
trends in the fields covered by the joint
conferences: representation theory, integrability,

entanglement, quantum groups, number theory, conformal geometry, quantum affine superalgebras, noncommutative geometry. Further, they present various mathematical results: on minuscule modules, symmetry breaking operators, Kashiwara crystals, meta-conformal invariance, the superintegrable Zernike system.

Local Cohomology M. P. Brodmann, R. Y.

Sharp, 2012-11-15 This second edition of a successful graduate text provides a careful and detailed algebraic introduction to Grothendieck's local cohomology theory, including in multi-graded situations, and provides many illustrations of the theory in commutative algebra and in the geometry of quasi-affine and quasi-projective varieties. Topics covered include Serre's Affineness Criterion, the Lichtenbaum–Hartshorne Vanishing Theorem, Grothendieck's Finiteness Theorem and Faltings' Annihilator Theorem, local duality and canonical modules, the Fulton–Hansen Connectedness Theorem for projective varieties, and connections between local cohomology and both reductions of ideals and sheaf cohomology. The book is designed for graduate students who have some experience of basic commutative algebra and homological algebra and also experts in commutative algebra and algebraic geometry. Over 300 exercises are interspersed among the text; these range in difficulty from routine to challenging, and hints are provided for some of the more difficult ones.
