Invertebrate Learning and Memory Paul R. Benjamin, 2013-06-18 Understanding how network

mechanisms contribute to behavioral plasticity is a key objective in learning and memory studies. This is likely to be complex because the different types of synaptic and nonsynaptic (cellular and neuronal) changes that underlie memory are known to occur at multiple locations within the neural network. Determining how these multiple changes are integrated to generate network correlates of learning is the major goal of a systems analysis. Gastropod mollusks offer the advantage that behavioral plasticity can be directly linked to network and the cellular analysis of learning because of the ability to identify individual neurons and determine their synaptic connectivity. Important progress has been made in understanding the synaptic and nonsynaptic contributions to network changes underlying simple forms of nonassociative (habituation and sensitization) and associative (classical and operant conditioning) learning and, to a lesser extent, more complex types of behavior such as second-order conditioning.

Thinking Outside the Box Gary R. Edgerton,Brian Geoffrey Rose,2005-01-01 Thinking Outside the Box brings together some of the best and most challenging scholarship about TV genres, exploring their genesis, their functions and development, and the interaction of disparate genres. The authors argue that genre is a process rather than a static category and that it signifies much about the people who produce and watch the shows. In addition to considering traditional genres such as sitcoms, soap operas, and talk shows, the contributors explore new hybrids, including reality programs, teen-oriented science fiction, and quality dramas, and examine how many of these shows have taken on a global reach. Identifying historical continuities and envisioning possible trends, this is the richest and most

current study of how television genres form, operate, and change.
