Skylab Shayler David, 2001-05-28 Between May 1973 and February 1974 three teams of astronauts increased the American space endurance record from 14 days, set in 1965, to three months aboard the Skylab space station in missions lasting 28, 59 and 84 days. American astronauts did not surpass these records for over 20 years until the NASA Mir missions began in 1995. In *Skylab - America's space station*, David Shayler chronicles the evolution of the station, its infrastructure on the ground including astronaut training, each of the three manned missions, summary of results, achievements and the lessons learned. The creation of the International Space Station is the real legacy of Skylab as American astronauts once again embark on extended missions around the Earth.

Homesteading Space David Hitt, Owen K. Garriott, Joe Kerwin, 2008-01-01 As the United States and the Soviet Union went from exploring space to living in it, a space station was conceived as the logical successor to the Apollo moon program. But between conception and execution there was the vastness of space itself, to say nothing of monumental technological challenges. *Homesteading Space*, by two of Skylab's own astronauts and a NASA journalist, tells the dramatic story of America's first space station from beginning to fiery end. *Homesteading Space* is much more than a story of technological and scientific success; it is also an absorbing, sometimes humorous, often inspiring account of the determined, hardworking individuals who shepherded the program through a near-disastrous launch, a heroic rescue, and an exhausting study of Comet Kohoutek, as well as the lab's ultimate descent into the Indian Ocean. Featuring the unpublished in-flight diary of astronaut Alan Bean, the book is replete with the personal recollections and experiences of the Skylab crew and those who worked with them in training, during the mission, and in bringing them safely home.

Skylab Skylab, Jeff Kovel, 2023-03-09 A major overview of Skylab's built works, from show-stopping residences to high-profile cultural projects, presented via a covetable book design that takes its inspiration from an album or LP.

Skylab Experiments Skylab Program,1973

Skylab a Guidebook Leland F. Belew,Ernst Stuhlinger,2012-03 Skylab's launch in 1973 represented a major milestone in America's space program. Intended to enrich scientific knowledge of the Earth, Sun and space, America's first space station was also intended to prove that humans could live and work in zero gravity for extended periods. The station's design originated from a 1959 proposal by Wehrner von Braun to use an empty rocket stage as an orbiting laboratory -- Skylab's Orbital Workshop design was built around a Saturn S-IVB stage. With a total length of about 117 feet and a mass of 169.950 pounds, the station was about the size of an average house. It included a multi-spectral solar observatory, two docking ports, and Airlock Module with EVA hatches, and a large habitation area. Power on-board came from solar arrays and the fuel cells of the docked Apollo CSM. Skylab was damaged by vibrations during lift-off, destroying an important meteoroid shield and one of the station's two solar panel arrays. The second array could not be deployed until the crew of the SL-2 mission made an EVA to fix it. The crew remained in space for 28 days, a record eclipsed by the next two missions SL-3 (59 days) and SL-4 (84 days). After the SL-4 crew returned to the Earth in 1974 plans were made to refurbish Skylab, but delays with the Space Shuttle program proved fatal, and the station re-entered Earth's atmosphere and disintegrated in 1979. Dating from just prior to the station's deployment in 1973, this informative book was originally published by NASA to explain Skylab's mission to the public. Featuring chapters detailing the station's history, design, components, operation, and research projects, it presents an important overview of the Skylab program.

Skylab 3 Dwight Steven-Boniecki,2016-12 Book & DVD. With the successful repair of the Skylab workshop by Pete Conrads Skylab 2 crew the stage was now set for his fellow Apollo 12 moon walker Alan Bean to lead a full scientific mission to the giant space station. Bean was to be accompanied by two of the next generation of astronauts, Owen Garriott and Jack Lousma. The crew were launched on a Saturn IB on 28 July 1973 for a mission which would last for just short of two months. This would be by far the longest duration mission ever attempted by the United States. Just as the previous mission had required space walks, Skylab 3 would also see the crew venture outside on three separate occasions. The experience gained from these early repair missions would be of incalculable value to the future of manned space exploration. Having secured the station and completed the repairs begun by Conrads crew, Bean, Lousma and Garriott conducted an intensive series of experiments on themselves and on behalf of students back on Earth. They also began the serious study of our home planet through the Skylab Earth Resources Experiment Package and undertook meaningful studies of the Sun using the Apollo Telescope Mount. Many of the paradigms for life aboard the International Space Station began right here with the flight of Skylab 3.

Monitoring the crews reaction to long duration exposure to micro-gravity, watching the effect on small organisms, carefully studying the earths ecosphere, looking out into deep space with the benefit of clear skies and generally learning whether humanity could withstand the rigors of long missions away from the Earth. In this book you will discover everything from the minutiae of complex experiments to the human face of some of the earliest true space residents. Once again the enormous Skylab workshop would provide them with a home.

Skylab 4 Dwight Steven-Boniecki, 2016-12 Book & DVD. By the end of 1973 the United States was firmly entrenched in its long-term space station program. The Skylab Orbital Workshop had managed to survive its birthing pains and had already successfully carried two crews in low earth orbit when Apollo astronauts Gerald Carr, William Pogue and Ed Gibson strapped themselves atop one of the remaining Saturn IB super boosters. Destined to be the second-to-last crew to fly in the remarkable Apollo spacecraft the three men would spend an unprecedented 84 days in space. Although none of them had any previous spaceflight experience they had all trained for many years in hopes of a trip to the moon, only to find themselves slated to set new long-duration records for spaceflight. Over almost three months Carr, Pogue and Gibson conducted an inordinate amount of experiments inside the cavernous Skylab space station. They studied the sun in ways never before achieved, monitoring solar flares and coronal mass ejections from our home star. They also began the first real work of earth observation. The crew of Skylab 4 proved that it was possible for humans to live in space for extended periods without too many adverse effects. They worked out the first stringent space exercise regimens to help them to maintain their health and they conducted multiple spacewalks. Without a doubt, the crew of Skylab 4 pioneered the way forward in space station research and their efforts would light the path for the International Space Station. In this book you will find the remarkable details of NASAs final early space station experiment through the original documents published at the time of the mission, including the mission debriefing telling the story in the crews own words. Included with this book is a DVD featuring launch video of the Skylab 4 mission, rare audio of the re-entry of Skylab with a Skylab slideshow, Skylab 4 Status Report, Skylab 4 Inflight Press Conference, The Legacy of Skylab and more!

Live TV from the Moon Dwight Steven-Boniecki, 2010 Book & DVD. The further the lunar landings regress into history, the more important the TV images have become. Until now the background story of this important footage has been overlooked. The TV systems used on Apollo were not without controversy. When President Kennedy issued the challenge to successfully land men on the moon and return them safely to earth by the end of the 1960's, NASA unwittingly found itself facing a two-fold predicament. Should the American taxpayer be privy to a front row seat via television, and would it be possible to develop compact TV cameras for just such a purpose within the allotted timeframe? Drawing upon the skill and knowledge of RCA and Westinghouse engineers a series of TV cameras were developed which revolutionised not only space exploration, but electronic news gathering as a whole. This book covers everything from the earliest known proposals of lunar TV coverage, and on through the political battles that ultimately led to the TV system which flew on the Apollo missions. The book takes what some may see as a very sterile or niche topic, and extends it into an interesting subject anyone can understand and appreciate. This book

can be compared to the Making of. . . documentaries which often accompany feature films. For the first time, the live telecasts from the moon are given their own complete Making of. . . account.
