Vanadium Dioxide-Based Thermochromic Smart Windows Yi Long, Yanfeng Gao, 2021-05-28 The usage of building energy accounts for 30–40% of total energy consumption in developed countries, exceeding the amount for industry or transportation. Around 50% energy for building services is contributed by heating, ventilation, and air-conditioning (HVAC) systems. More importantly, both building and HVAC energy consumptions are predicted to increase in the next two decades. Windows are considered as the least energy-efficient components of buildings. Therefore, smart windows are becoming increasingly important as they are capable of reducing HVAC energy usage by tuning the transmitted sunlight in a smart and favoured way: blocking solar irradiation on hot days, while letting it pass through on cold days. Compared with other type of smart windows, thermochromic windows have the unique advantages of cost-effectiveness, rational stimulus, and passive response. This book covers fabrication of vanadium dioxide-based smart windows, discusses various strategies to enhance their performance, and shares perspectives from the top scientists in this particular field.

Nanostructured Electrochromic Materials for Smart Switchable Windows Avinash Balakrishnan, Praveen Pattathil, 2018-10-26 This book focuses on next-generation smart windows which can change their optical-physical properties by reflecting and/or transmitting incoming light radiation to attain comfortable indoor temperatures throughout the year. Offers in-depth discussion of a range of materials and devices related to different technologies used in manufacturing smart windows Discusses basic principles, materials synthesis and thin film fabrication, and optical and electrochemical characterization techniques

Fabrication of Smart Windows by a Hybrid Process Using Sol-gel and Other Techniques Vo-Van Truong,CANMET Energy Technology Centre (Canada),1997 Describes a project to adapt the sol-gel method for the preparation of individual thin films of solid-state ionic materials used in an electrochromic device and to fabricate and test such a device, with a view toward its application in energy-efficient windows whose optical properties can be changed by application of an electric field. After an introduction, the second and third chapters describe the sol-gel methodology and the methods used for preparation of each of the thin film layers. Results of studies of the electrical, optical, electrochemical, and electrochromic properties of each layer are enumerated and compared to those of similar films prepared by other methods. Subsequent chapters detail the preparation of indium tin oxide film used as a transparent conductor, the tungsten trioxide base layer, the vanadium pentoxide storage layer (counter electrode), and gel- and polymer-type lithium ion conductors. Chapter 7 discusses the performance of different types of electrochromic devices made from different combinations of the component layers. The conclusion summarizes the overall achievements of the project and its potential commercial applications.

Theoretical Analysis and Performance Evaluation of Smart Windows Lingqi Su, 2021* Buildings account for one-third of the global final energy consumption, and space heating and cooling are responsible for around 40% of the building total energy use. Meanwhile, designing buildings with large glazing area has become an architectural trend since decades. To achieve energy conservation in buildings with large glazing area, the application of novel technologies is of high importance. In this study, a novel triple glazed fluidic window is introduced. This fluidic window contains one or multiple micro-structured glass panes, which can be used for fluid circulation. With this concept, different application cases can be realized, such as heating/cooling panel for indoor air-conditioning, heat exchanger for heat pump or switchable solar shading. This work concentrates on the feasibility investigation and the energy efficiency of the application cases. For the theoretical analysis, several simplified modeling methods for the triple glazed fluidic window are presented and validated with coupled heat transfer and fluid flow numerical simulation. With the presented models, this work shows that using magnetic particle suspended fluid as the circulating fluid inside the triple glazed fluidic window reduces building's solar heat gain and thus the cooling loads becomes lower. Furthermore, when two glass panes are replaced with the capillary glass panes, the triple glazed window becomes a decentral heat pump. Moreover, over-bridging the inner and the outer fluidic glass pane enables passive cooling. A simulation study shows that this device can reach a high energy efficiency. For the future work on this subject, the author suggests that the possibility of integrating an energy harvesting device into the fluidic window, or using the fluidic window directly

as an energy harvesting device, should be further explored.

Smart Buildings Marco Casini, 2016-05-27 *Smart Buildings: Advanced Materials and Nanotechnology to Improve Energy Efficiency and Environmental Performance* presents a thorough analysis of the latest advancements in construction materials and building design that are applied to maximize building efficiency in both new and existing buildings. After a brief introduction on the issues concerning the design process in the third millennium, Part One examines the differences between Zero Energy, Green, and Smart Buildings, with particular emphasis placed on the issue of smart buildings and smart housing, mainly the 'envelope' and how to make it more adaptive with the new possibilities offered by nanotechnology and smart materials. Part Two focuses on the last generation of solutions for smart thermal insulation. Based on the results of extensive research into

more innovative insulation materials, chapters discuss achievements in nanotechnology, bio-ecological, and phase-change materials. The technical characteristics, performance level, and methods of use for each are described in detail, as are the achievements in the field of green walls and their use as a solution for upgrading the energy efficiency and environmental performance of existing buildings. Finally, Part Three reviews current research on smart windows, with the assumption that transparent surfaces represent the most critical element in the energy balance of the building. Chapters provide an extensive review on the technical features of transparent closures that are currently on the market or under development, from so-called dynamic glazing to bio-adaptive and photovoltaic glazing. The aesthetic potential and performance limits are also be discussed. Presents valuable definitions that are given to explain the characteristics, requirements, and differences between 'zero energy', 'green' and 'smart' buildings Contains particular focus on the next generation of construction materials and the most advanced products currently entering the market Lists both the advantages and disadvantages to help the reader choose the most suitable solution Takes into consideration both design and materials aspects Promotes the existence of new advanced materials providing technical information to encourage further use and reduce costs compared to more traditional materials
