Current Research in Pulsed Laser Deposition Liviu Duta, Andrei C. Popescu, 2021-08-30 Despite its limitation in terms of surface covered area, the PLD

technique still gathers interest among researchers by offering endless possibilities for tuning thin film composition and enhancing their properties of interest due to: (i) the easiness of a stoichiometric transfer even for very complex target materials, (ii) high adherence of the deposited structures to the substrate, (iii) controlled degree of phase, crystallinity, and thickness of deposited coatings, (iv) versatility of the experimental set-up which allows for simultaneous ablation of multiple targets resulting in combinatorial maps or consecutive ablation of multiple targets producing multi-layered structures, and (v) adjustment of the number of laser pulses, resulting in either a spread of nanoparticles, islands of materials or a complete covering of a surface. Moreover, a variation of PLD, known as Matrix Assisted Pulsed Laser Evaporation, allows for deposition of organic materials, ranging from polymers to proteins and even living cells, otherwise difficult to transfer unaltered in the form of thin films by other techniques. Furthermore, the use of laser light as transfer agent ensures purity of films and pulse-to-pulse deposition allows for an unprecedented control of film thickness at the nm level. This Special Issue is a collection of state-of-the art research papers and reviews in which the topics of interest are devoted to thin film synthesis by PLD and MAPLE, for numerous research and industry field applications, such as bio-active coatings for medical implants and hard, protective coatings for cutting and drilling tools withstanding high friction and elevated temperatures, sensors, solar cells, lithography, magnetic devices, energy-storage and conversion devices, controlled drug delivery and in situ microstructuring for boosting of surface properties.

Designing with Smart Textiles Sarah Kettley,2016-06-02 If you want to understand, and be a part of, the creative revolution in materials design, then Designing with Smart Textiles is the complete toolkit you need to get started. Beginning by introducing the terminology and key applications, the book goes on to examine the key design processes needed to develop interactive textile design concepts, with detailed projects and examples to help you apply these approaches in your own practice. Case studies and interviews with innovative designers introduce you to different artistic and technological practices, and demonstrate how world-leading researchers are creating new technologies, yarns, fabrics, and applications. Practitioners share unique insights into their processes, and "Tech Tips" so you can build on their research in your own work. Featured designers include: Yemi Awosile, Joanna Berzowska, Lauren Bowker, Marina Castan, Cute Circuit, Felecia Davis, Debbie Davies, Delia Dumitrescu, Martha Glazzard, Ramyah Gowrishankar, Intelligent Textiles Ltd., Sara Keith, Ebru Kurbak and Irene Posch, Barbara Layne, Eef Lubbers, Anna Persson, Mette Ramsgaard Thomsen, Rose Sinclair, Mike Starbuck, Lynn Tandler, Paola Tognazzi, Sarah Walker and Linda Worbin

Relentless Visionary Michael Berick, If asked to list important inventors, few remember to include Alessandro Volta. Yet, his is a household name more spoken than that of Alexander Graham Bell, the Wright Brothers, or even Thomas Edison. That's because the terms "volt" and "voltage" can be attributed to Volta, the inventor of the "Voltaic pile," which is recognized as the first electric battery. A product of the Age of Enlightenment—a time when ideas about reason, science, literature and liberty took center stage—Volta employed a very modern, hands-on approach to his work. Though he had no formal education, he was the first person to identify the gas known as methane, and created the first authoritative list of conducting metals. Alessandro Volta saw things not just as they were, but as what they could be. He was a disrupter, an innovator and a visionary. Above all, he was relentless. Without Volta's hunger to create and his drive to invent and discover, we might not have electric cars, laptops, cellphones, and hearing aids today.

System-level Modeling of MEMS Oliver Brand, Gary K. Fedder, Christofer Hierold, Jan G. Korvink, Osamu Tabata, 2012-12-20 System-level modeling of MEMS - microelectromechanical systems - comprises integrated approaches to simulate, understand, and optimize the performance of sensors, actuators, and microsystems, taking into account the intricacies of the interplay between mechanical and electrical properties, circuitry, packaging, and design considerations. Thereby, system-level modeling overcomes the limitations inherent to methods that focus only on one of these aspects and do not incorporate their mutual dependencies. The book addresses the two most important approaches of system-level modeling, namely physics-based modeling with lumped elements and mathematical modeling employing model order reduction methods, with an emphasis on combining single device models to entire systems. At a clearly understandable and sufficiently detailed level the readers are made familiar with the physical and mathematical underpinnings of MEMS modeling. This enables them to choose the adequate methods for the respective application needs. This work is an invaluable resource for all materials scientists, electrical engineers, scientists working in the semiconductor and/or sensor industry, physicists, and physical chemists.
