Wave Propagation in Complex Media George Papanicolaou, 2012-12-06 This IMA Volume in Mathematics and its Applications WAVE PROPAGATION IN COMPLEX MEDIA is based on the proceedings of two workshops: • Wavelets, multigrid and other fast algorithms (multipole, FFT) and their use in wave propagation and • Waves in random and other complex media. Both workshops were integral parts of the 1994-1995 IMA program on Waves and Scattering. We would like to thank Gregory Beylkin, Robert Burrigge, Ingrid Daubechies, Leonid Pastur, and George Papanicolaou for their excellent work as organizers of these meetings. We also take this opportunity to thank the National Science Foundation (NSF), the Army Research Office (ARO), and the Office of Naval Research (ONR), whose financial support made these workshops possible. A vner Friedman Robert Gulliver v PREFACE During the last few years the numerical techniques for the solution of elliptic problems, in potential theory for example, have been drastically improved. Several so-called fast methods have been developed which reduce the required computing time many orders of magnitude over that of classical algorithms. The new methods include multigrid, fast Fourier transforms, multipole methods and wavelet techniques. Wavelets have recently been developed into a very useful tool in signal processing, the solution of integral equation, etc. Wavelet techniques should be quite useful in many wave propagation problems, especially in inhomogeneous and nonlinear media where special features of the solution such as singularities might be tracked efficiently.

Diffuse Waves in Complex Media Jean-Pierre Fouque, 2012-12-06 The NATO Advanced Study Institute on Diffuse Waves in Complex Media was held at the Centre de Physique des Houches in France from March 17 to 27, 1998. The School's scientific content, wave propagation in heterogeneous media, has covered many areas of fundamental and applied research. On the one hand, the understanding of wave propagation has considerably improved during the last thirty years. New developments and concepts such as, speckle correlations, weak and strong localization, time reversal, near-field propagation are under active research. On the other hand, wave propagation in random media is now being investigated in many different fields such as applied mathematics, acoustics, optics, atomic physics, geophysics or medical sciences. Each community often uses its own language to describe the same phenomena. The aim of the School was to gather worldwide specialists to illuminate various aspects of wave propagation in random media. This volume presents fourteen expository articles corresponding to courses and seminars given during the School. They are arranged as follows. The first three articles deal with the phenomena of localization of waves: B. van Tiggelen (p. 1) gives a critical review of the physics of localization, J. Lacroix (p. 61) presents the mathematical theory and A. Klein (p. 73) describes recent results for randomized periodic media.

Grands Vins Clive Coates, 1995-06-07 By far France's largest fine-wine region, Bordeaux is also arguably its greatest, and perhaps the greatest in the world. This extensive survey details the region's history, geography, grape varieties, and other regional wine-making idiosyncracies. Master of Wine Clive Coates profiles the leading chateaux and assesses their top red and white wines. 150 drawings. Map.

Nanometer Scale Science and Technology Maria Allegrini,Nicolás García,Othmar Marti,2001

Nanosciences and nanotechnology are at the interface between physics, chemistry, engineering and biology. The fundamental processes of living matter occur on the nanometre scale. This book is based on local probes (STM, AFM, SNOM) and related supreme technological achievements. Topics are covered extensively, covering issues such as: clusters, nanocontacts, photonic band gap materials, atom manipulation by light, atom optics with Bose-Einstein condensates, and quantum computing.

The Emergence of EU Defense Research Policy Nikolaos Karampekios,Iraklis Oikonomou,Elias G.

Carayannis,2017-11-16 This book explores European security and defense R&D policy, unveiling the strategic, industrial, institutional and ideational sources of the European Commission's military research initiative. Starting from a well-defined empirical epicentre—the rise of non-civilian R&D priorities in the European Union—this book covers interrelated themes and topics such as approaches to arms production and R&D collaboration relationships between European R&D-related institutions technology and research foundations of European security policy past and present European armament collaborations transatlantic R&D collaboration the militarization of border security. Divided into 5 sections, the enclosed chapters explore the EU technology and innovation policy in regards to security, industrial competitiveness and military capabilities. The terrorist attacks in the US on September 11, 2001 provided a window of opportunity for the introduction of security as a distinct European R&D priority. In fact, since 2002, the Preparatory Action for Security Research (PASR) has funded 45 million euros to 39 research consortia to conduct security R&D. While the idea of pooling defense research efforts and programmes in Europe is not new, the establishment of institutions like the European Defense Agency (EDA) are a major step into institutionalizing European agencies involvement in supporting defense technology research. It is against this backdrop of policy developments that this book is positioned, in addition to addressing some of the political, economic, industrial and philosophical questions that arise. Featuring contributions from a variety of academic fields and industries, this book will be of interest to scholars, researchers, students and policy makers in the fields of security policy, international relations, innovation, European studies and military studies.

Topics in Computational Materials Science Ching-yao Fong,1998 This book describes the state-of-the-art research topics in theoretical materials science. It encompasses the computational methods and techniques which can advance more realistic calculations for understanding the physical principles in new growth methods of optoelectronic materials and related surface problems. These principles also govern the photonic, electronic, and structural properties of materials which are essential for device applications. They will also provide the crucial ingredients for the growth of future novel materials.

International Education Programs and Political Influence I. Wilson, 2014-04-16 Exchange programs are often considered to create goodwill for host countries among foreign citizens - yet is this the case? Drawing on a wealth of research with participants and alumni of exchange programs, Iain Wilson shows that the pursuit of goodwill receives little return and distracts these programs from the benefits they are able to deliver.

The Case Study of the ERASMUS Programme in Latvia Karina Oborune, 2010-12 Master's Thesis from the year 2010 in the subject Politics - International Politics - Topic: European Union, grade: B+, Central European University Budapest, language: English, abstract: The European Commission and scholars emphasize that the ERASMUS programme is a successful example of European integration, a symbol of construction of European identity and promoter of tolerance on the basis of breaking stereotypes, encouraging multicultural experience and intercultural education. But because of the lack of empirical findings, this Master thesis has been devoted to research of the impact of the ERASMUS programme on breaking the stereotypes and fostering European identity. The quantitative survey of three hundred thirty former ERASMUS, potential ERASMUS and non-ERASMUS students provides partly justification that the ERASMUS Programme has impact on breaking the stereotypes and promoting European identity. Potential ERASMUS students already have less stereotypes and European self-identification than non-mobile students, therefore the ERASMUS programme is rather catalyst than promoter of European identity and stereotypebreaker. Key words: the ERASMUS programme, European identity, stereotypes.

Photonic Crystals and Light Localization in the 21st Century C.M. Soukoulis, 2012-12-06 This volume contains papers presented at the NATO Advanced Study Institute (ASI) Photonic Crystals and Light Localization held at the Creta Maris Hotel in Limin Hersonissou, Crete, June 18-30, 2000. Photonic crystals offer unique ways to tailor light and the propagation of electromagnetic waves (EM). In analogy to electrons in a crystal, EM waves propagating in a structure with a periodically modulated dielectric constant are organized into photonic bands, separated by gaps where propagating states are forbidden. There have been proposals for novel applications of these photonic band gap (PBG) crystals, with operating frequencies ranging from microwave to the optical regime, that include zero threshold lasers, low-loss resonators and cavities, and efficient microwave antennas. Spontaneous emission, suppressed for photons in the photonic band gap, offers novel approaches to manipulate the EM field and create high-efficiency light-emitting structures. Innovative ways to manipulate light can have a profound influence on science and technology.

Photonic Band Gap Materials C.M. Soukoulis, 2012-12-06 Photonic band gap crystals offer unique ways to tailor light and the propagation of electromagnetic waves. In analogy to electrons in a crystal, EM waves propagating in a structure with a periodically-modulated dielectric constant are organized into photonic bands separated by gaps in which propagating states are forbidden. Proposed applications of such photonic band gap crystals, operating at frequencies from microwave to optical, include zero- threshold lasers, low-loss resonators and cavities, and efficient microwave antennas. Spontaneous emission is suppressed for photons in the photonic band gap, offering novel approaches to manipulating the EM field and creating high-efficiency light-emitting structures. Photonic Band Gap Materials identifies three most promising

areas of research. The first is materials fabrication, involving the creation of high quality, low loss, periodic dielectric structures. The smallest photonic crystals yet fabricated have been made by machining Si wafers along (110), and some have lattice constants as small as 500 microns. The second area is in applications. Possible applications presented are microwave mirrors, directional antennas, resonators (especially in the 2 GHz region), filters, waveguides, Y splitters, and resonant microcavities. The third area covers fundamentally new physical phenomena in condensed matter physics and quantum optics. An excellent review of recent development, covering theoretical, experimental and applied aspects. Interesting and stimulating reading for active researchers, as well as a useful reference for non-specialists.
