Computational Fluid Dynamics Review 1998 (In 2 Volumes) Hafez Mohamed M, Oshima Koichhi, 1998-11-20 The first volume of CFD Review was published in 1995. The purpose of this new publication is to present comprehensive surveys and review articles which provide up-to-date information about recent progress in computational fluid dynamics, on a regular basis. Because of the multidisciplinary nature of CFD, it is difficult to cope with all the important developments in related areas. There are at least ten regular international conferences dealing with different aspects of CFD. It is a real challenge to keep up with all these activities and to be aware of essential and fundamental contributions in these areas. It is hoped that CFD Review will help in this regard by covering the state-of-the-art in this field. The present book contains sixty-two articles written by authors from the US, Europe, Japan and China, covering the main aspects of CFD. There are five sections: general topics, numerical methods, flow physics, interdisciplinary applications, parallel computation and flow visualization. The section on numerical methods includes grids, schemes and solvers, while that on

flow physics includes incompressible and compressible flows, hypersonics and gas kinetics as well as transition and turbulence. This book should be useful to all researchers in this fast-developing field.

Software Development on a Leash David Birmingham,Valerie Haynes Perry,2002-03-25 Software Development on a Leash is designed as a roadmap for experienced developers and architects who are interested in implementing a turbocharged software development process that encourages reuse and innovation. Author David Birmingham's products have been successfully deployed in a variety of venues, including highly complex desktop environments, with rapid turnaround and high-intensity delivery deadlines. This book contrasts the application-centric development approach to the architecture-centric development approach, introducing the concept of the metamorphic superpattern—the capability of a software program to dynamically adapt to changing application requirements without rebuilding the binary executable. Birmingham invites the reader to deploy reusable structural and behavioral building blocks, along with some powerful frameworks to gain immediate traction in any setting. He includes a high-speed multidimensional toolkit to organize and deploy the building blocks, essentially weaving the application together at run-time rather than being hard-wired in program code. Birmingham then ties the building blocks together with structural and behavioral metadata, allowing simple, interpreted macros to drive everything from database access, screen layouts, and many aspects of software development normally embedded directly into the software program and reused! The rapid deployment effect this creates allows developers to perform simple surgical application changes or rapid, sweeping rework/enhancement—without changing compiled software.
