Fuzzy Rule Based Computer Design John R. Newport,1995-10-09 This book provides the theory and some examples of rule based reasoning applied to computer design. The presentation begins with design methods. These include both structured, object oriented design applied to software and systems engineering using several examples. Rule based reasoning, fuzzy logic, and new methods of virtual prototyping of computer designs are also covered. Virtual prototyping, in contrast to hardware prototyping, offers the promise of much lower design cost and more time to prepare prototypes. A discussion on this topic concludes with a sample implementation of these methods that can be used for computer system design.

Air Forces of Latin America Santiago Rivas,2022-02-28 Military aviation in Argentina has a long history and for many years it was the most powerful in Latin America, achieving worldwide fame in 1982 when it confronted British forces over the South Atlantic. Sadly, as a result of Argentina's more recent economic woes and a lack of political commitment over more three decades, it is now struggling to maintain its capabilities and replace old aircraft. Ironically, this situation makes for a varied and interesting aviation scene, with Argentine military aviation flying many classic types that are not easy to see in operation today with a military force, as well as some less-common indigenous aircraft. Illustrated with more than 140 photographs, this book shines a spotlight on the Argentine Air Force, Naval Aviation and Army Aviation, as well as the paramilitary forces of the Coast Guard, Gendarmerie and Presidential Flight. Author Santiago Rivas gives a fascinating insight into their histories, comprehensive details of their current organization, their missions and the aircraft they operate, and full 'orders of battle' for each air arm.

Tactical Aircraft Programs Curt Weldon,1998-06 Hearing on the DoD's tactical aircraft programs, primarily the F-22, the F/A-18E/F, and the joint strike fighter. Desert Storm showed that an effective tactical air power component of the military is fundamental for our national military strategy. In the past, billions of dollars were spent developing aircraft we didn't procure or an aircraft we procured in quantities too little to justify the developmental costs. DoD faces an annual procurement shortfall of $20 billion and a projected increase in infrastructure costs of $26 billion between 1997 and 2001. Testimony from: DoD; Joint Chiefs of Staff; CBO, and the GAO. Includes schedules, and cost charts for aircraft.

Cockpit Displays: Test and Evaluation Richard L. Newman,Kevin W. Greeley,2017-03-02 Cockpit Displays is an in-depth examination of the design rationales, test philosophy and test procedures for cockpit systems. Whilst its main emphasis is on cockpit displays, it also includes an important discussion of flight management systems and mission computers. Areas covered include: the cockpit design process, test techniques for flight displays and equipment, and situation awareness testing. Comparing civil and military requirements, it is an important analysis of the lessons learned from test and evaluation and will be of interest to cockpit systems design engineering staff at major airframe manufacturers, procurement executives and program managers at military aircraft program offices and flight test engineers and test pilots.

Software Maintenance - A Management Perspective Phaneendra Nath Vellanky,2007-10-23 Computer systems play an important role in our society. Software drives those systems. Massive investments of time and resources are made in developing and implementing these systems. Maintenance is inevitable. It is hard and costly. Considerable resources are required to keep the systems active and dependable. We cannot maintain software unless maintainability characters are built into the products and processes. There is an urgent need to reinforce software development practices based on quality and reliability principles. Though maintenance is a mini development lifecycle, it has its own problems. Maintenance issues need corresponding tools and techniques to address them.

Software professionals are key players in maintenance. While development is an art and science, maintenance is a craft. We need to develop maintenance personnel to master this craft. Technology impact is very high in systems world today. We can no longer conduct business in the way we did before. That calls for reengineering systems and software. Even reengineered software needs maintenance, soon after its implementation. We have to take business knowledge, procedures, and data into the newly reengineered world. Software maintenance people can play an important role in this migration process. Software technology is moving into global and distributed networking environments. Client/server systems and object-orientation are on their way. Massively parallel processing systems and networking resources are changing database services into corporate data warehouses. Software engineering environments, rapid application development tools are changing the way we used to develop and maintain software. Software maintenance is moving from code maintenance to design maintenance, even onto specification maintenance. Modifications today are made at specification level, regenating the software components, testing and integrating them with the system. Eventually software maintenance has to manage the evolution and evolutionary characteristics of software systems. Software professionals have to maintain not only the software, but the momentum of change in systems and software. In this study, we observe various issues, tools and techniques, and the emerging trends in software technology with particular reference to maintenance. We are not searching for specific solutions. We are identifying issues and finding ways to manage them, live with them, and control their negative impact.
