Approaches to Prototyping R. Budde, K.

Kuhlenkamp, L. Mathiassen, H. Züllighoven, 2012-12-06

This conference will focus on the user-oriented

development of information systems. Against a

background of recent concepts for the

implementation of distributed systems based on

workstation computers, various communicational,

organizational and social issues gain increasing

importance in the construction of computer based

information systems. There is an urgent need to

integrate end-users and other affected groups into

the development process. New strategies for system

development are thus needed. This was the beginning of the Call for Papers to the Working Conference on Prototyping. Working in the fields of user-oriented software construction and the analysis of communication problems between developers and users we, that is the GMD team involved in this conference and in preparing its Proceedings, sooner or later came across various new concepts to overcome the problems sketched above. Concepts focusing on the quick construction of an operative system such as rapid prototyping or concepts aiming at the human and organizational side of the development process such as Systemeering. Even on a second look, the multitude of different approaches, terms and tools still caused confusion. But despite the differences every concept seemed to have something to do with Prototyping. This, however, proved to be of little help to us, because the term Prototyping itself turned out to be quite fuzzy. In this obviously confused situation we decided that it was time for a working conference.

Social analysis for inclusive agrifood investments Christensen, I., Romano, M., 2023-12-12 More than a decade has passed since the publication of the series entitled Social Analysis of Agriculture and Rural Investment Projects, which comprises three complementary manuals – the Manager's, Practitioner's and Field guides. During this time, conflict, climate change and economic downturns have been driving up poverty, hunger, and socioeconomic inequalities, reducing the resilience of agrifood systems. In response, the FAO Investment Centre has updated the Social Analysis guides to address the evolving and volatile rural transformation context, providing programme managers, practitioners and field workers with a set of enhanced tools for the design, implementation and evaluation of inclusive investments in agrifood systems. Today's investments must prioritize more demand-driven, people-centred, culturally sensitive and locally

owned sustainable approaches, with increased attention to reducing gender and other inequalities. Operationalizing these principles contributes to FAO's and financing agencies' objectives of ending poverty, improving food security and nutrition, and reducing inequalities. The goal of the updated guides is to support investments that contribute to inclusive, resilient and sustainable agrifood systems, aligned with the outcomes of the UN Food Systems Summit, the Sustainable Development Goals (SDGs), and the core principle of leaving no one behind. This publication is part of the Investment Toolkits series under the FAO Investment Centre's Knowledge for Investment (K4I) series. The contents of this publication have been turned into three e-learning courses, which are accessible for free through the FAO E-learning Academy.

Software Estimation Best Practices, Tools & Techniques Murali Chemuturi, 2009-07-15 Almost every software project begins with the utterances, "What will this cost?" and "When will this project be done?" Once those words are spoken, project stakeholders begin to wrestle with how to produce an estimate. Accurately estimating the cost or time to complete a software project is a serious problem for many software engineers, developers and project managers who struggle with costs running double original estimates, putting their careers at risk. It is reported that nearly 50% of all software projects are shelved and that one of

the major causes is poor estimation practices. If developing software for internal use, poor estimates can represent a significant drain on corporate profits. Worldwide growth in the number of companies specializing in the development of software for use by other companies is staggering. India alone has nearly 20,000 such companies. Intense competition has led to an increased demand for fixed-bid pricing in client/vendor relationships, and has made effective cost estimation even more important and, in many cases, critical to a firm's survival. There are many methods of estimation. Each method has its strengths and weaknesses, proponents and opponents. Knowing how and which one to use on a given project is key to developing acceptable estimates for either internal or external projects. Software Estimation Best Practices, Tools, & Techniques covers all facets of software estimation. It provides a detailed explanation of the various methods for estimating software size, development effort, cost, and schedule, including a comprehensive explanation of Test Effort Estimation. Emphasizing that software estimation should be based on a well-defined process, it presents software estimation best practices and shows how to avoid common pitfalls. This guide offers direction on which methods are most appropriate for each of the different project types commonly executed in the software development space and criteria for selecting software estimation tools. This comprehensive desk reference explains software estimation from scratch to help the beginner and features advanced

techniques for more experienced estimators. It details project scheduling, including resource leveling and the concept of productivity, as applicable to software estimators, demonstrating the many benefits of moving from the current macro-productivity approach to a micro-productivity approach in software estimation. Software Estimation Best Practices, Tools, & Techniques: A Complete Guide for Software Project Estimators caters to the needs of all software project stakeholders, from novice to expert. It provides the valuable guidance needed to estimate the cost and time required to complete software projects within a reasonable margin of error for effective software development.
