Mobile Security Products for Android Philipp Kratzer, Christoph Gruber, Andreas Clementi, David Lahee, Philippe Rödlach, Peter Stelzhammer, 2014-10-14 We have once again tested security products for smartphones running Google's Android operating system. Our report covers details of the products made by leading manufacturers. Smartphones represent the future of modern communications. In 2013, more than 1 billion smartphones were sold, a further milestone in the advance of these devices¹. A study published by Facebook emphasises the importance of smartphones in our lives; about 80% of users make use of their smartphone within 15 minutes of waking up each day. At the same time, the traditional function of a telephone is becoming less and less important. The high quality of integrated cameras means that the smartphone is increasingly used for photography. As well as with photos, users trust their devices with their most personal communications, such as Facebook, WhatsApp and email. This brings some risks with it, as such usage makes the smartphone interesting for criminals, who attempt to infect the device with malware or steal personal data. There is also the danger brought by phishing attacks. These days, the use of security software on a PC or laptop is seen as essential. However, many smartphone users do not yet have the same sense of responsibility, even though their devices store personal data, private photos, Internet banking information or even company data. As modern smartphones are often expensive to buy, they are also an attractive target for thieves. Top-quality smartphones cost several hundred Euros. As it is not possible to physically prevent them from being stolen, they must be made less attractive to thieves. Consequently, many of today's security products contain not only malware protection, but also highly developed theft-protection functions, which make the device less attractive to thieves (e.g. by locking the device), and help the owner to find it again.

Android Malware and Analysis Ken Dunham, Shane Hartman, Manu Quintans, Jose Andre Morales, Tim Strazzere, 2014-10-24 The rapid growth and development of Android-based devices has resulted in a wealth of sensitive information on mobile devices that offer minimal malware protection. This has created an immediate need for security professionals that understand how to best approach the subject of Android malware threats and analysis. In *Android Malware and Analysis*, Ken Dunham, renowned global malware expert and author, teams up with international experts to document the best tools and tactics available for analyzing Android malware. The book

covers both methods of malware analysis: dynamic and static. This tactical and practical book shows you how to use dynamic malware analysis to check the behavior of an application/malware as it has been executed in the system. It also describes how you can apply static analysis to break apart the application/malware using reverse engineering tools and techniques to recreate the actual code and algorithms used. The book presents the insights of experts in the field, who have already sized up the best tools, tactics, and procedures for recognizing and analyzing Android malware threats quickly and effectively. You also get access to an online library of tools that supplies what you will need to begin your own analysis of Android malware threats. Tools available on the book's site include updated information, tutorials, code, scripts, and author assistance. This is not a book on Android OS, fuzz testing, or social engineering. Instead, it is about the best ways to analyze and tear apart Android malware threats. After reading the book, you will be able to immediately implement the tools and tactics covered to identify and analyze the latest evolution of Android threats. Updated information, tutorials, a private forum, code, scripts, tools, and author assistance are available at AndroidRisk.com for first-time owners of the book.

Spying Software Development in Google Android Fissha SeyoumTeshome, 2017-06-28
Bachelor Thesis from the year 2011 in the subject Computer Science - IT-Security, Helsinki Metropolia University of Applied Sciences, language: English, abstract: The main purpose was to study the concept behind developing spying software. The goal of this project was to develop a mobile phone tracking application for Google Android phones. The application was expected to include the use of GPS and Cell-ID to track the location of a mobile phone. The Google Android SDK was used to develop the tracking software application. The application was tested on a Google Android mobile phone. The result showed that the development process of location and maps-based applications was fast while using Google Android. This was because of two main reasons. First, Google Android Provided APIs for location-based services such as GPS and Cell-ID. Second, having Eclipse with ADT plug-in as the choice to develop the application led to an easy means of debugging and testing. The tracking application was found important to use since it will allow users to trace lost phones or to locate lost people. The application can be developed further by adding a number of features to it such as running in the background, SMS copying and making a spy call.

Differences Between the Security Models of Android and iOS Samuel Hopstock,2019-07-24 Seminar paper from the year 2018 in the subject Computer Science - IT-Security, grade: 1,0, Technical University of Munich, course: Seminar Mobile Application Security, language: English, abstract: Smartphones are being used as the preferred device for as many things as possible in today's world. This is why having secure phones that are resilient against attacks targeting their users' data, becomes more and more important. This paper tries to assess what measures device vendors have taken to ensure those attacks will not be successful. Because the market is mostly divided between Google's Android and Apple's iOS, we put our focus on those two operating systems and compare their respective security models. Additionally this comparison will be evaluating how those models have changed over time since the beginning of the smartphone era around 2010. The last part of this analysis will take a look at a different view on smartphones, the perspective of so-called power users: Those are people that do not only use their smartphone for downloading some apps and surfing the Internet but rather want to do some lower-level customization to the operating

system, by rooting their Android device or jailbreaking their iPhone. This process of gaining full privileges on the phone not only creates advantages for the user but can also have rather negative implications on the device's security. How exactly does this affect the protections implemented by the vendor?

Malicious Mobile Code Roger A. Grimes,2001-08-14 Malicious mobile code is a new term to describe all sorts of destructive programs: viruses, worms, Trojans, and rogue Internet content. Until fairly recently, experts worried mostly about computer viruses that spread only through executable files, not data files, and certainly not through email exchange. The Melissa virus and the Love Bug proved the experts wrong, attacking Windows computers when recipients did nothing more than open an email. Today, writing programs is easier than ever, and so is writing malicious code. The idea that someone could write malicious code and spread it to 60 million computers in a matter of hours is no longer a fantasy. The good news is that there are effective ways to thwart Windows malicious code attacks, and author Roger Grimes maps them out in *Malicious Mobile Code: Virus Protection for Windows*. His opening chapter on the history of malicious code and the multi-million dollar anti-virus industry sets the stage for a comprehensive rundown on today's viruses and the nuts and bolts of protecting a system from them. He ranges through the best ways to configure Windows for maximum protection, what a DOS virus can and can't do, what today's biggest threats are, and other important and frequently surprising information. For example, how many people know that joining a chat discussion can turn one's entire computer system into an open book? *Malicious Mobile Code* delivers the strategies, tips, and tricks to secure a system against attack. It covers: The current state of the malicious code writing and cracker community How malicious code works, what types there are, and what it can and cannot do Common anti-virus defenses, including anti-virus software How malicious code affects the various Windows operating systems, and how to recognize, remove, and prevent it Macro viruses affecting MS Word, MS Excel, and VBScript Java applets and ActiveX controls Enterprise-wide malicious code protection Hoaxes The future of malicious mobile code and how to combat such code These days, when it comes to protecting both home computers and company networks against malicious code, the stakes are higher than ever. *Malicious Mobile Code* is the essential guide for securing a system from catastrophic loss.

Malware Detection in Android Phones Sapna Malik,2017-11-06 The smartphone has rapidly become an extremely prevalent computing platform, with just over 115 million devices sold in the third quarter of 2011, a 15% increase over the 100 million devices sold in the first quarter of 2011, and a 111% increase over the 54 million devices sold in the first quarter of 2010. Android in particular has seen even more impressive growth, with the devices sold in the third quarter of 2011 (60.5 million) almost triple the devices sold in the third quarter of 2010 (20.5 million), and an associated doubling of market share. This popularity has not gone unnoticed by malware authors. Despite the rapid growth of the Android platform, there are already well-documented cases of Android malware, such as DroidDream, which was discovered in over 50 applications on the official Android market in March 2011. Furthermore, it is found that Android's built-in security features are

largely insufficient, and that even non malicious programs can (unintentionally) expose confidential information. A study of 204,040 Android applications conducted in 2011 found 211 malicious applications on the official Android market and alternative marketplaces. The problem of using a machine learning-based classifier to detect malware presents the challenge: Given an application, we must extract some sort of feature representation of the application. To address this problem, we extract a heterogeneous feature set, and process each feature independently using multiple kernels. We train a One-Class Support Vector Machine using the feature set we get to classify the application as a benign or malware accordingly.
