Direct Air Capture of CO2 Hoda Shokrollahzadeh Behbahani,Matthew D.

Green,2023-06-23 Direct air capture is a negative emission technology that captures CO₂ directly from the air. It is shown to be a promising tool for fighting climate change, yet still a work in progress. Direct Air Capture of CO₂ provides an overview of this technology, starting with an overview in Chapter 1 of major climate change events, moving into a comprehensive review of negative emission technologies in Chapter 2, including direct air capture. Chapter 2 covers some of the challenges associated with direct air capture and the feasibility of utilizing such a process for large-scale applications. Chapter 3 presents a literature review of sorbents under investigation for direct air capture. The advantages and disadvantages of each approach for direct air capture are extracted from results published in the literature and are summarized along with areas of ongoing work. Parallel to ongoing research on developing high-performing sorbents for direct air capture, companies and startups have begun testing pilot to commercial scale direct air capture plants. Chapter 4 summarizes the efforts of such institutions. Global CO₂ markets under development to construct commercialization pathways for direct air capture, such as enhanced oil recovery, synthetic fuels, cement, greenhouses, and food and beverages, are also reviewed in Chapter 4. The digital primer concludes with the authors' view on the prospects of direct air capture technology for fighting climate change. Information provided in all chapters is carefully referenced to relevant literature so the reader may dive deeper into the details if interested. The authors hope this digital primer will bring inspiration and ideas to young scientists.

Negative Emissions Technologies and Reliable Sequestration National Academies of Sciences, Engineering, and Medicine,Division on Earth and Life Studies,Ocean Studies Board,Board on Chemical Sciences and Technology,Board on Earth Sciences and Resources,Board on Agriculture and Natural Resources,Board on Energy and Environmental Systems,Board on Atmospheric Sciences and Climate,Committee on Developing a Research Agenda for Carbon Dioxide Removal and Reliable Sequestration,2019-04-08 To achieve goals for climate and economic growth, negative emissions technologies (NETs) that remove and sequester carbon dioxide from the air will need to play a significant role in mitigating climate change. Unlike carbon capture and storage technologies that remove carbon dioxide emissions directly from large point sources such as coal power plants, NETs remove carbon dioxide directly from the atmosphere or enhance natural carbon sinks. Storing the carbon dioxide from NETs has the same impact on the atmosphere and climate as simultaneously preventing an equal amount of carbon dioxide from being emitted. Recent analyses found that deploying NETs may be less expensive and less disruptive than reducing some emissions, such as a substantial portion of agricultural and land-use emissions and some transportation emissions. In 2015, the National Academies published Climate Intervention: Carbon Dioxide Removal and Reliable Sequestration, which described and initially assessed NETs and sequestration technologies. This report acknowledged the relative paucity of research on NETs and recommended development of a research agenda that covers all aspects of NETs from fundamental science to full-scale deployment. To address this need, Negative Emissions Technologies and Reliable Sequestration: A Research Agenda assesses the benefits, risks, and sustainable scale potential for NETs and sequestration. This report also

defines the essential components of a research and development program, including its estimated costs and potential impact.

Gruppé on Painting Emile A. Gruppé,1976 Dust jacket notes: Vibrant, fresh, immediate! The direct oil painting technique is an intense reaction to nature, a race with time to capture the color, the light and shadow, the design and the spirit of a subject in a few short hours. And now, Emile Gruppé - master of the direct oil painting technique - shows how you can use the broad strokes and lively colors of this spontaneous approach to infuse your own paintings with vitality, vigor, and on-the-spot freshness. A firm believer in using the best materials for the best results, Gruppé begins with a quick review of his favorite brushes, colors, easels, and painting surfaces. Next, he covers the basics of good design, what to look for and how to orchestrate what you see: masses, lines, values, and relationships. Turning to color, a fundamental element of his painting technique, Gruppé discusses complements, color harmony, color vibration, local color, reflected color, and using color to create atmospheric perspective. He explains how color appears on various kinds of days - foggy, clear, cloudy - and under different lighting conditions - front lighting, backlighting, sidelighting. In subsequent chapters, the author focuses on composing seascapes and landscapes; he explains how to paint rocks, ocean, lighthouses, boats, piers, pilings, roads, trees, streams, snow, mountains, valleys. Then, in full-color step-by-step demonstrations, the author shows how he captures a subject in his unique, exuberant, on-the-spot style.

Electrical Drives for Direct Drive Renewable Energy Systems Markus Mueller,Henk Polinder,2013-03-25 Wind turbine gearboxes present major reliability issues, leading to great interest in the current development of gearless direct-drive wind energy systems. Offering high reliability, high efficiency and low maintenance, developments in these direct-drive systems point the way to the next generation of wind power, and Electrical drives for direct drive renewable energy systems is an authoritative guide to their design, development and operation. Part one outlines electrical drive technology, beginning with an overview of electrical generators for direct drive systems. Principles of electrical design for permanent magnet generators are discussed, followed by electrical, thermal and structural generator design and systems integration. A review of power electronic converter technology and power electronic converter systems for direct drive renewable energy applications is then conducted. Part two then focuses on wind and marine applications, beginning with a commercial overview of wind turbine drive systems and an introduction to direct drive wave energy conversion systems. The commercial application of these technologies is investigated via case studies on the permanent magnet direct drive generator in the Zephyros wind turbine, and the Archimedes Wave Swing (AWS) direct drive wave energy pilot plant. Finally, the book concludes by exploring the application of high-temperature superconducting machines to direct drive renewable energy systems. With its distinguished editors and international team of expert contributors, Electrical drives for direct drive renewable energy systems provides a comprehensive review of key technologies for anyone involved with or interested in the design, construction, operation, development and optimisation of direct drive wind and marine energy systems. An authoritative guide to the design, development and operation of gearless
