Imaging in Cellular and Tissue Engineering Hanry Yu, Nur Aida Abdul Rahim, 2013-05-16 Details on specific imaging modalities for different cellular and tissue engineering applications are

scattered throughout articles and chapters in the literature. Gathering this information into a single reference, *Imaging in Cellular and Tissue Engineering* presents both the fundamentals and state of the art in imaging methods, approaches, and applications in regenerative medicine. The book underscores the broadening scope of imaging applications in cellular and tissue engineering. It covers a wide range of optical and biological applications, including the repair or replacement of whole tissues (such as bone, cartilage, blood vessels, and bladder) and more novel artificially created support systems (such as artificial pancreas and bioartificial liver). Each chapter describes a particular application, relevant optical instrumentation, physical principles governing the imaging method, and strengths and weaknesses of the technique. The book also presents current and emerging data processing procedures. As the field of tissue engineering moves from creating simpler outer body parts to more sophisticated internal organs, researchers need to evaluate and control how well the tissues are engineered and integrated into the living body. Suitable for both experts and newcomers in bioengineering and biomedical imaging, this book shows researchers how to apply imaging techniques to next-generation engineered cells and tissues. It helps them assess the suitability of specific imaging modalities for applications with various functional requirements.

X-ray fluorescent scanning of the thyroid M.H. Jonckheer, Frank Deconinck, 2012-12-06 Just prior to the 1982 Annual Meeting of the European Thyroid Association in Brussels, a number of outstanding experts in the field of X-ray fluorescence gathered at the Academisch Ziekenhuis of the Free University of Brussels in a joint effort to more clearly define the actual place and value of the latest newcomer among the techniques available for the in vivo assessment of thyroid function. It is the merit of Prof. M. Jonckheer to have organised this meeting and to have made available the work presented there to a larger public in the form of this monograph. Both, the meeting and the written

accounts thereof are greatly appreciated by all thyroidologists who care for properly defining the genuine value of X-Ray fluorescence in scientific research and in clinical management of thyroid disorder. Three main conclusions can be drawn from the work presented 1. X-ray fluorescence has become a safe, convenient and reliable tool for measuring intrathyroidal iodine stores in vivo with an inter-assay reproducibility estimated at roughly 10% 2. X-ray fluorescence, used by expert hands, is a highly interesting tool to follow changes of intra thyroidal iodine stores in time, subsequent e. g. to the exposure of the thyroid gland to excess iodine 3. In contrast, no definite place of X-ray fluorescence as a technique in routine assessment of thyroid disease is yet at the horizon This latter conclusion may appear somewhat disappointing.

Creep in Structures Michal Zyczkowski, 2013-03-08 There is a tradition to organize IUTAM Symposia Creep in Structures every ten years: the first Symposium was organized by N.J. Hoff in Stanford (1960), the second one by J. Hult in Goteborg (1970), and the third one by A.R.S. Ponter in Leicester (1980). The fourth Symposium in Cracow, September 1990, gathered 123 participants from 21 countries and reflected rapid development of the theory, experimental research and structural applications of creep and viscoplasticity, including damage and rupture. Indeed, the scope of the Symposium was broad, maybe even too broad, but it was kept according to the tradition. Probably the chairman of Creep in Structures V in the year 2000 (if organized at all) will be forced to confine the scope substantially. Participation in the Symposium was reserved for invited participants, suggested by members of the Scientific Committee. Total number of suggestions was very large and the response - unexpectedly high. Apart from several papers rejected, as being out of scope, over 100

papers were accepted for presentation. A somewhat unconventional way of presentation was introduced to provide ample time for fruitful and well prepared discussions: besides general lectures (30 minutes each), all the remaining papers were presented as short introductory lectures (10 minutes) followed by a 1-hour poster discussion with the authors and then by a general discussion. Such an approach made it possible to present general ideas orally, and then to discuss all the papers through and through.

Palliative Treatment for Advanced Cancer Patients Cynthia Pereira de Araújo,2023-05-05

This book presents an important reflection on the concept and limits of the Fundamental Right to Health as opposed to a supposed “Right to Hope” in the context of the treatment of patients with advanced cancer. The central idea of the work is the question of whether and to what extent patients with advanced cancer have the right to legally demand a palliative treatment whose efficacy has not been proven from the point of view of the desired objectives. The book demonstrates how hope cannot be subject to legal protection and, also, that, even if theoretical-legal reasons were not sufficient for the absence of an abstract right to hope, ethical reasons would be. The work concludes that the best palliative care, rather than palliative treatment, guarantees the best right to health for advanced cancer patients, especially in terminal cases. In addition to this theoretical discussion, the book also presents the results of a qualitative research the author conducted with 48 advanced cancer patients in Brazil and Germany to investigate their expectations towards chemotherapy. This study has confirmed that many patients decide to undergo often toxic and exhausting treatments, unrealistically believing that their cancer is curable or that, as long as they continue with a course of chemotherapy, cancer may be beaten. *Palliative Treatment for Advanced Cancer Patients: Can Hope Be a Right?* will be of interest to health professionals and social workers working with advanced cancer patients, as well as to researchers in the fields of public health, bioethics, medical ethics and health law, especially those interested in the growing interdisciplinary field of end-of-life decision-

making.

Investigating Cellular Nanoscale with X-rays Clément Hémonnot, 2016 The advances and technical improvements of X-ray imaging techniques, taking advantage of X-ray focussing optics and high intensity synchrotron sources, nowadays allow for the use of X-rays to probe the cellular nanoscale. Importantly, X-rays permit thick samples to be imaged without sectioning or slicing. In this work, two macromolecules, namely keratin intermediate filament (IF) proteins and DNA, both essential components of cells, were studied by X-ray techniques. Keratin IF proteins make up an integral part of the cytoskeleton of epithelial cells and form a dense intracellular network of bundles. This network is built from monomers in a hierarchical fashion. Thus, the keratin structure formation spans a large range of length scales from a few nanometres (monomers) to micrometres (networks). Here, keratin was studied at three different scales: i) filaments, ii) bundles and iii) networks. Solution small-angle X-ray scattering revealed distinct structural and organisational characteristics of these highly charged polyelectrolyte filaments, such as increasing radius with increasing salt concentration and spatial accumulation of ions depending on the salt concentration. The results are quantified by employing advanced modelling of keratin IFs by a core cylinder flanked with Gaussian chains. Scanning micro-diffraction was used to study keratin at the bundle scale. Very different morphologies of keratin bundles were observed at different salt conditions. At the network scale, new imaging approaches and analyses were applied to the study of whole cells. Ptychography and scanning X-ray nano-diffraction imaging were performed on the same cells, allowing for high resolution in real and

reciprocal space, thereby revealing the internal structure of these networks. By using a fitting routine based on simulations of IFs packed on a hexagonal lattice, the radius of each filament and distance between filaments were retrieved. In mammalian cells, each nucleus contains 2 nm-thick DNA double helices with a total length of about 2 m. The DNA strands are packed in a highly hierarchical manner into individual chromosomes. DNA was studied in intact cells by visible light microscopy and scanning X-ray nano-diffraction, unveiling the compaction and decompaction of DNA during the cell cycle. Thus, we obtained information on the aggregation state of the nuclear DNA at a real space resolution on the order of few hundreds nm. To exploit the reciprocal space information, individual diffraction patterns were analysed according to a generalised Porod's law at a resolution down to 10 nm. We were able to distinguish nucleoli, heterochromatin and euchromatin in the nuclei and follow the compaction and decompaction during the cell division cycle.
