The Virus and the Vaccine Debbie Bookchin, Jim Schumacher, 2013-07-02 Jonas Salk's polio vaccine has taken on an almost legendary quality as a medical miracle, for it largely eradicated one of the most feared diseases of the 20th century. But the story of the vaccine has a dark side, one that has never been fully told before... Between 1954 and 1963, close to 98 million Americans received polio vaccinations contaminated with a carcinogenic monkey virus, now known as SV40. A concerted government effort downplayed the incident, and it was generally accepted that although oncogenic to laboratory animals, SV40 was harmless to humans. But now SV40 is showing up in human cancers, and prominent researchers are demanding a serious public health response to this forgotten polio vaccine contaminant. A gripping medical detective story, The Virus and the Vaccine raises major questions about vaccine policy.

**Influenza Virus and Vaccination** Marta L.

DeDiego, Aitor Nogales, 2020-05-28 The influenza virus poses a threat to human health and is responsible for global epidemics every year. In addition to seasonal infections, influenza can cause occasional pandemics of great consequence when novel viruses are introduced into humans. Despite the implementation of comprehensive vaccination programs, influenza viruses continue to pose an important and unpredictable global public health threat. They are one of the most significant causes of morbidity and mortality each year and have a significant economic impact. In recent years, research has been conducted to find alternative approaches to influenza vaccine development, including the generation of universal vaccines. Notably, significant progress in the field of influenza infection, transmission, and immunity have

contributed to our understanding of influenza biology, and to expanding the technological approaches for the generation of more efficient strategies against influenza infections. Moreover, highly remarkable developments have been made in the implementation of new methodologies to evaluate the efficiency of vaccines and improve them for use on domestic animals such as poultry, horses, dogs or pigs. This enables us to decrease the exposure of humans to potentially pandemic viruses. The articles in this Special Issue will address the importance of influenza to human health and the advances in influenza research that have led to the development of better therapeutics and vaccination strategies.

**The Panic Virus** Seth Mnookin, 2012-01-03 A searing account of how vaccine opponents have used the media to spread their message of panic, despite no scientific evidence to support them.

**Vaccines for Pandemic Influenza** Richard W Compans, Walter A. Orenstein, 2009-09-18 Recent years have seen unprecedented outbreaks of avian influenza A viruses. In particular, highly pathogenic H5N1 viruses have not only resulted in widespread outbreaks in domestic poultry, but have been transmitted to humans, resulting in numerous fatalities. The rapid expansion in their geographic distribution and the possibility that these viruses could acquire the ability to spread from person to person raises the risk that such a virus could cause a global pandemic with high morbidity and mortality. An effective influenza vaccine represents the best approach to prevent and control such an emerging pandemic. However, current influenza vaccines are directed at existing seasonal influenza viruses, which have little or no antigenic relationship to the highly pathogenic H5N1 strains. Concerns about pandemic preparedness have greatly

stimulated research activities to develop effective vaccines for pandemic influenza viruses, and to overcome the limitations inherent in current approaches to vaccine production and distribution. These limitations include the use of embryonated chicken eggs as the substrate for vaccine production, which is time-consuming and could involve potential biohazards in growth of new virus strains. Other limitations include the requirement that the current inactivated influenza vaccines be administered using needles and syringes, requiring trained personnel, which could be a bottleneck when attempting to vaccinate large populations in mass campaigns. In addition, the current inactivated vaccines that are delivered by injection elicit limited protective immunity in the upper respiratory tract where the infection process is initiated.

Novel Strategies in the Design and Production of Vaccines Sara Cohen, Avigdor Shafferman, 2013-06-29  
Vaccination is one of the most efficient and cost effective methods of promoting human health and has been in clinical use for at least 200 years. Nevertheless, infectious diseases continue to constitute a constant threat to the well being of humanity. Common pathogens, once believed to be under control, acquire increased virulence and resistance to drugs, while exotic microorganisms emerged from hidden reservoirs to cause yet incurable diseases in humans. These changes, together with epidemic outbreaks related to political and socio-economic instabilities, increase the needs for the development of new, advanced vaccines. In this volume, devoted to the proceedings of the 39th OHOLO Conference, we present some of the recent strategies for the design and production of novel vaccines. The advent of recombinant DNA technology has stimulated the production of several subunit vaccines. In spite of the obvious advantages to this approach, the limited immuno

genicity of many subunit candidates has hindered their development. Strategies to enhance the immunogenicity of subunit vaccines is therefore critical. Several approaches toward this goal, including design of novel adjuvants and delivery systems as well as design of advantageous carriers, are presented here. Among the carriers evaluated here are polypeptides (flagellin, HBV core antigen, J3-galactosidase), attenuated virions (Vaccinia, Sindbis), and nonpathogenic licensed bacteria (Salmonella).

**Immunization Safety Review** Immunization Safety Review Committee, 2003-11-26 The Immunization Safety Review Committee was established by the Institute of Medicine (IOM) to evaluate the evidence on possible causal associations between immunizations and certain adverse outcomes, and to then present conclusions and recommendations. The committee's mandate also includes assessing the broader societal significance of these immunization safety issues. While all the committee members share the view that immunization is generally beneficial, none of them has a vested interest in the specific immunization safety issues that come before the group. The committee reviews three immunization safety review topics each year, addressing each one at a time. In this fifth report in a series, the committee examines the hypothesis that exposure to polio vaccine contaminated with simian virus 40 (SV40), a virus that causes inapparent infection in some monkeys, can cause certain types of cancer.

*The Rinderpest Campaigns* Amanda Kay

McVety, 2018-08-31 Amanda Kay McVety has written the first history of the international effort to eradicate rinderpest - a devastating cattle disease - which began in the 1940s and ended in 2011. Rinderpest is the only other disease besides smallpox to have been eradicated, but very few people in the United States know about it, because it did not infect humans and never broke out in North America. In other parts of the world, however, rinderpest was a serious economic and social burden and the struggle against it was a critical part of the effort to fight poverty and hunger globally. McVety follows the deployment of rinderpest vaccines around the globe, exploring the role of the environment in the understanding of development, internationalism, and national security. She expands the standard Cold War narratives to show how these concepts were framed not only by economic and political concerns, but also by biological ones.

**The Cutter Incident** Paul A. Offit, 2005-10-10 A history and analysis of the tragic 1955 American pharmaceutical disaster involving one company's polio vaccine. Vaccines have saved more lives than any other single medical advance. Yet today only four companies make vaccines, and there is a growing crisis in vaccine availability. Why has this happened? This remarkable book recounts for the first time a devastating episode in 1955 at Cutter Laboratories in

Berkeley, California, that has led many pharmaceutical companies to abandon vaccine manufacture. Drawing on interviews with public health officials, pharmaceutical company executives, attorneys, Cutter employees, and victims of the vaccine, as well as on previously unavailable archives, Dr. Paul Offit offers a full account of the Cutter disaster. He describes the nation's relief when the polio vaccine was developed by Jonas Salk in 1955, the production of the vaccine at industrial facilities such as the one operated by Cutter, and the tragedy that occurred when 200,000 people were inadvertently injected with live virulent polio virus: 70,000 became ill, 200 were permanently paralyzed, and 10 died. Dr. Offit also explores how, because of the tragedy, one jury's verdict set in motion events that eventually suppressed the production of vaccines already licensed and deterred the development of new vaccines that hold the promise of preventing other fatal diseases. Praise for *The Cutter Incident* "Offit . . . has written a fascinating and highly readable account of the development of the polio vaccine. He also offers a compelling plea for a strengthened law to provide relief to companies that produce vaccines so that our nation may be afforded the most cost-effective and long-lasting form of prevention against many infectious diseases—an effective vaccine." —Stanley Goldfarb, *New York Post* "The best account you will ever read about the interplay between big drug companies and bigger government." —Peter Huber, *Forbes* "The book is very well written and reads almost like a detective story, with a nice balance between personal anecdotes and new materials not discussed in other accounts of the Cutter incident. It draws on meticulous archival documentation and on interviews with public health officers, pharmaceutical company executives, Cutter employees, and victims of the partially inactivated vaccine.

... An important and valuable contribution.” —Nadav Davidovitch, Isis “Well written and easily understood, yet balanced with enough technical detail for medical professionals to read informatively cover to cover.”

**Hepatitis B** Irving Millman, Toby K. Eisenstein, Baruch S. Blumberg, 2013-11-11 Toby K. Eisenstein Symposium Committee Chairperson Temple University School of Medicine Philadelphia, Pennsylvania 19140 This symposium is the thirteenth biennial clinical microbiology program sponsored by the Eastern Pennsylvania Branch of the American Society for Microbiology in cooperation with the Philadelphia area medical schools and the Bureau of Laboratories of the Pennsylvania Department of Health. This year a generous contribution from Merck, Sharp and Dohme has helped to make the program a reality. The subject matter for this symposium represents an attractive spectrum of medical, biological and molecular approaches to the practical solution of a public health problem—namely, prevention of infection with the hepatitis B virus. The symposium may be unique in that it focuses on a product which was first marketed less than three months ago, but included in the program are presentations on two new approaches to hepatitis B vaccine production which may replace the one which is newly unveiled. The rapidity of progress in our present era of biological research is indeed astonishing.

*Replicating Vaccines* Philip R. Dormitzer, Christian W. Mandl, Rino Rappuoli, 2010-11-02 Technological advances, together with a better understanding of the molecular biology of infectious microorganisms, are creating exciting possibilities for a new generation of replicating vaccines. Historically, live vaccines have been either directly derived from a natural source or attenuated by empirical

approaches using serial passages and host cell adaptation. Currently, we are witnessing a quantum leap in our technological capabilities to specifically modify the genetic make-up of viruses and bacteria, making it possible to generate improved live vaccines and to develop completely new types of replicating vaccines, such as vectored vaccines, single-round infectious vaccines and replicon vaccines. This book highlights some of the most exciting recent developments towards a new generation of replicating vaccines.

**Protective Immune Response to Dengue Virus Infection and Vaccines: perspectives from the field to the bench** Simona Zompi, Scott Halstead, 2015-04-14  
Dengue is the most important mosquito-transmitted viral disease in humans. Half of the world population is at risk of infection, mostly in tropical and sub-tropical areas. The World Health Organization (WHO) estimates that 50 to 100 million infections occur yearly, with 50,000 to 100,000 deaths related to dengue, mainly in children. Recent estimates show higher numbers, up to three times more, with 390 million estimated dengue infections per year, among which 96 million apparent infections (Bhatt et al. 2013). Initially localized to South-East Asia, dengue virus (DENV) started its spread in Latin America in the 80's. Little is known about DENV spread in Africa, but multiple seroprevalence surveys over several years are now clearly showing endemic areas in East and West Africa (Brady et al. 2013). Finally, due to global warming and intense traveling

there is a risk of global spread towards more temperate regions, and both US Key islands (FL) and southern Europe recently faced DENV outbreaks. There are currently no specific treatments or vaccines available. Even though several dengue vaccines are in the pipeline, clear correlates of protection are still lacking. The recent failure of the live-attenuated Sanofi vaccine Phase 2b trial (Sabchareon et al. 2013) and the lack of correlation between clinical protection and in vitro neutralization assays, clearly underlines the necessity to better understand the role of the different components of the immune system in protection against dengue virus infection and the requirement for the development of additional and/or improved predictive assays. The aim of this research topic is to provide novel data, opinions and literature reviews on the best immune correlates of protection and recent advances in the immune response to DENV infection that can allow rapid progress of dengue vaccines. Authors can choose to submit original research papers, reviews or opinions on pre-clinical or clinical observations that will help unify the field, with perspectives from epidemiology, virology, immunology and vaccine developers. This research topic will discuss different aspects of the protective immune response to DENV that can influence vaccine development. It will include a review of epidemiological data generated in the field, which will address spatio-temporal diversity of DENV epidemics, the importance of cross-reactive protection and of the time-interval between infections as a predictor of disease. It will further include a review of the role of both the innate and adaptive immunity in DENV infection control, and discuss the usefulness of new improved animal models in dissecting the role of each immunological compartment, which will help define new correlate of immune protection. New data concerning the DENV structure and anti-dengue antibody

structure will address the necessity of improved neutralization assays. The ultimate test to prove vaccine efficacy and study immune correlates of protection in humans before large trials will open up the discussion on human DENV challenges using controlled attenuated viral strains. Finally, the role of vaccines, administered in flavivirus-immune populations, in the modification of future epidemics will also be approached and will include novel studies on mosquitoes infection thresholds.

**Challenges and Opportunities for Respiratory Syncytial Virus Vaccines** Larry J. Anderson,Barney S. Graham,2016-08-23 Although respiratory syncytial virus (RSV) has been a high priority for vaccine development for over 50 years now, still no vaccine is available and none has yet demonstrated sufficient promise to move to licensure. The success of RSV immune prophylaxis and the availability of ever more powerful tools to study the immune response and pathogenesis of disease, combined with the ability to construct a wide variety of vaccines using different vaccine platforms, give us grounds to believe that an RSV vaccine is within reach. This book brings together in one source what is currently known about the virus: its clinical and epidemiologic features; the host response and pathogenesis of the disease; vaccines, vaccine platforms, and treatment; and animal and tissue culture models of RSV infection. It is designed to organize the critical information relevant to RSV vaccine development, facilitate the assimilation of data, and speed progress toward producing a safe and effective vaccine.

**The Covid-19 Vaccine Guide** Kathryn M.

Edwards, Walter A. Orenstein, David S. Stephens, 2021-03-23  
What you should know about the Covid-19 vaccines from top experts in the field. As the SARS-Cov2 virus emerged and spread globally in early 2020, unprecedented international efforts began to develop and test vaccines to control the devastating pandemic. This book focuses on the remarkable progress in developing vaccines, the amazing effectiveness of the early vaccines, and the challenges of delivering them to the population. To put this extraordinary

progress into perspective, the history of other vaccines is presented and their roles in individual protection and protection of the community, “vaccines that protect the unvaccinated,” are outlined. The rigorous processes whereby vaccines are evaluated in distinct phases and the steps that must be met prior to obtaining regulatory approval for both vaccine safety and effectiveness are highlighted. Multiple vaccine approaches are reviewed, including new approaches such as “messenger or mRNA vaccine” that may revolutionize future vaccine development. The comprehensive models used to provide recommendations and priorities for vaccination of groups of people at risk are summarized. The book also focuses on the questions that remain unanswered after the vaccines are approved. These include duration of immunity, risk factors for vaccine failure, impact of viral evolution and variant strains, and assessment of both immediate and long-term safety. The authors also address concerns about vaccine acceptance including roll-out, access, and detailed and trusted sources of information.

**Viruses, Vaccines, and Antivirals: Why Politics Matters** Raj Chari, Isabel Rozas, 2021-11-08 This short book brings together novel cross-interdisciplinary investigation from both natural and social science, representing a true hybrid across disciplines examining the ‘politics’ and ‘science’ of COVID-19. *Viruses, Vaccines, and Antivirals: Why Politics Matters* considers the dynamics surrounding viruses, proposed vaccines, and antiviral therapies, contextualizing what governments have done during the COVID-19 crisis. The four basic phases of a pandemic are considered with a strong focus on COVID-19, namely the anticipating and early virus detection, containment strategies, policies to control and mitigate the spread of the virus and policies aimed at opening up society. *Viruses,*

Vaccines, and Antivirals: Why Politics Matters examines policy developments throughout these phases in key nations worldwide and puts forward a blueprint for countries developing public policies to deal with a pandemic.

The Flaviviruses: Detection, Diagnosis and Vaccine Development ,2003-12-18 Over 50% of known flaviviruses have been associated with human disease. The Flavivirus genus constitutes some of the most serious human pathogens including Japanese encephalitis, dengue and yellow fever. Flaviviruses are known for their complex life cycles and epidemic spread, and are considered a globally-emergent viral threat. Detection, Diagnosis and Vaccine Development, the third volume of The Flaviviruses details the current status of technologies for detection and differentiation of these viruses, their use in surveillance and outbreak investigation, and also reviews the latest clinical research. Comprehensive approach to the scientific disciplines needed to unravel the complexities of virus-host interactions Describes the technologies that have contributed to our current knowledge about the Flaviviruses Identifies the major problems faced in understanding the virus-host interactions that result in disease An exhaustive compendium of current and past knowledge on the Flavivirus family
