*Ambient Temperature and Health in China* Hualiang

Lin, Wenjun Ma, Qiyong Liu, 2019-06-07 This book focuses on the Chinese health impact induced by ambient temperature variation, especially the epidemiology-based exposure-response relationship with the mortality and morbidity from respiratory, cardiovascular diseases, and mental health among Chinese population. A great number of epidemiological studies have reported that ambient temperature is closely associated with a wide range of health outcomes, such as mortality, cardiovascular and respiratory events, adverse birth outcome, and some infectious diseases, such as dengue fever, malaria. Although a number of epidemiological studies in western countries have evaluated the adverse health effects of ambient temperature, the exposure-response relationship from these countries cannot simply be applied to the Chinese population due to the large differences in temperature profile, exposure pattern, as well as the population vulnerability. This book will provide up-to-date estimates of the magnitude of adverse health effects of ambient temperature in the Chinese population. We hope to provide readers with a comprehensive and organized body of information in the area of Ambient Temperature and health.

**Effects of high ambient temperature on short-term**

**memory** John F. Wing, 1965 The present study was designed to determine whether or not an increase in ambient temperature impaired man's ability to recall aurally-presented messages, and whether impairment was greater for some types of messages than for others. On three separate days, 15 men were exposed for 1 hour in an all-weather chamber to each of three different effective temperatures (ET): 72°, 90°, and 95° F. During each day's session they were given five successive recall trials on each of six different messages. The men had to work continuously during each hour-long session. The results showed that average recall dropped significantly as environmental temperature was increased. The recall decrement between 90° and 95° F was statistically significant, but the drop in recall between 72° and 90° F was not significant. Messages of all types suffered approximately equal decrements under the high temperatures.-- Abstract.

Comparative Physiology of Temperature Regulation John P. Hannon, Eleanor Viereck, 1962

Temperature Regulation Stewart Richards, 2013-12-17 MANY aspects of physiology are best understood in terms of bodily reactions to environmental stress, and temperature is one of the most often encountered stress factors in the environment. The responses to temperature can involve practically all of the organ systems of the body and it is for this reason that the study of the regulation of body temperatures represents one of the finest examples of complex reaction integrated by the nervous and endocrine systems, and hence of the principles of biological control. Thus, while thermoregulation offers an abundance of opportunities for the individual who likes to specialize in depth, it is an ideal type of physiology for those who prefer to think of the functioning of the body as whole. This book is written primarily for the undergraduate, but I hope also that some students may

find time to read it, before embarking on a university course, as an introduction to some of the ideas that will be encountered in the more detailed study of the biological sciences, including medicine. I have tried to discuss the evidence for important ideas, since this is fundamental to the scientific method, and have been particularly concerned to avoid the use of the sort of technical jargon that gives a spurious impression of authority while in reality creating confusion out of what is in essence simple.

**The Hot Brain** Carl V. Gisolfi, Mora Teruel Mora, 2000 The book traces the story of the brain throughout evolution and shows how the control of body temperature as a survival mechanism was achieved.

*The Cell and Environmental Temperature* A. S. Troshin, 2013-09-17 International Series of Monographs in Pure and Applied Biology: Zoology Division, Volume 34: The Cell and Environmental Temperature documents the proceedings of the International Symposium on Cytoecology held in Leningrad, U.S.S.R., from May 31 to June 5, 1965. This compilation focuses on the role of cellular reactions in the adaptation of multicellular organisms to environmental temperatures. The topics include the biochemical and physiological aspects of plant frost-resistance; mechanisms of resistance of poikilothermic animals to subfreezing temperatures; and changes in carbohydrate content of plants under heat-hardening. The analysis of seasonal changes in thermostability of frog muscles; effect of temperature on respiration and oxidative phosphorylation of pea seedlings; and metabolic and central nervous acclimation of fish to cold are also covered. This publication is intended for biologists concerned with the cytology, physiology, and ecology of plants and animals.

Hall, John Willis Hurst, 1990 A guide to the techniques and  
analysis of clinical data. Each of the seventeen sections begins  
with a drawing and biographical sketch of a seminal contributor  
to the discipline. After an introduction and historical survey of  
clinical methods, the next fifteen sections are organized by body  
system. Each contains clinical data items from the history,  
physical examination, and laboratory investigations that are  
generally included in a comprehensive patient evaluation.

**Temperature Regulation** A.S. Milton, 2012-12-06 Many  
advances have been made in the field of thermoregulation in the  
past few years. These include our understanding of Fever, which  
is now considered not simply a rise in deep body temperature  
foHowing infection, but just one aspect, though perhaps the most  
easily measured, of the Acute Phase of the Immune Response.  
Classification and identification of the Cytokines and the  
availability of recombinant material has greatly aided this  
research. Similarly, our understanding of the Hypothalamo-  
Pituitary Adrenal Axis has altered our way of thinking about  
temperature regulation. Of importance are the problems  
associated with adverse climatic conditions and survival, and the  
problems encountered by the neonate and the hibernator. At the  
biochemical level, our knowledge of the control of heat  
production and the role of brown adipose tissue is rapidly  
advancing. All these issues and many others were discussed at a  
Symposium 'Thermal Physiology 1993' held in Aberdeen, Scotland  
in August 1993 under the auspices of the Thermal Physiology  
Commission of the International Union of Physiological Sciences.

Six main aspects of the subject of temperature regulation are included in this book, namely, Fever (including the Acute Phase of the Immune Response and Thermoregulatory Peptides), Neurophysiology of Thermoregulation, Neonatal Thermoregulation, Mechanisms of Heat Production, Ecological and Behavioural Thermoregulation, and Emerging Themes in Thermoregulation.

**Temperature and Toxicology** Christopher J.

Gordon, 2005-02-28 Thermoregulation is vital for survival but the interplay between toxic insults and thermoregulatory mechanisms is often poorly understood. *Temperature and Toxicology: An Integrative, Comparative, and Environmental Approach* is the first major text to study the integrative thermoregulatory responses of mammals that are exposed to toxicants. Because environmental physiology is also crucial in toxicological responses, this volume also examines the role of environmental temperature in the modulation of cellular mechanisms of toxicity. The book begins by explaining the importance of temperature in toxicological studies, and how all biological processes are dependent on temperature. It then reviews the basics of temperature regulation in homeotherms and poikilotherms, and addresses whole-animal and in vitro studies related to the effects of temperature on toxicity. The text examines thermoregulatory response to toxic insult, and how responses affect recovery and potential survival. It describes hypothermic response in rodents to febrile and hyperthermic reactions in humans, and discusses the relevance of heat and cold stress on human exposures to airborne pollutants and other toxicants. This volume provides an extensive comparison of physiological responses of invertebrates, fish, amphibians, and mammals, and focuses on the impact of endocrine disruption. It then considers how toxicants and thermal stress cause the expression of stress proteins, followed by a study of the impact of genetic variability. The book concludes with an examination of thermoregulatory response to natural toxins and venoms.
