The Emotional Brain Joseph Ledoux,2015-09-22 What happens in our brains to make us feel fear, love, hate, anger, joy? Do we control our emotions, or do they control us? Do animals have emotions? How can traumatic experiences in early childhood influence adult behavior, even though we have no conscious memory of them? In *The Emotional Brain*, Joseph LeDoux investigates the origins of human emotions and explains that many exist as part of complex neural systems that evolved to enable us to survive. One of the principal researchers profiled in Daniel Goleman's *Emotional Intelligence*, LeDoux is a leading authority in the field of neural science. In this provocative book, he explores the brain mechanisms underlying our emotions -- mechanisms that are only now being revealed.

*Teaching with Poverty in Mind* Eric Jensen,2010-06-16 In *Teaching with Poverty in Mind: What Being Poor Does to Kids' Brains and What Schools Can Do About It*, veteran educator and brain expert Eric Jensen takes an unflinching look at how poverty hurts children, families, and communities across the United States and demonstrates how schools can improve the academic achievement and life readiness of economically disadvantaged students. Jensen argues that although chronic exposure to poverty can result in detrimental changes to the brain, the brain's very ability to adapt from experience means that poor children can also experience emotional, social, and academic success. A brain that is susceptible to adverse environmental effects is equally susceptible to the positive effects of rich, balanced learning environments and caring relationships that build students' resilience, self-esteem, and character. Drawing from research, experience, and real school success stories, *Teaching with Poverty in Mind* reveals \* What poverty is and how it affects students in school; \* What drives change both at the macro level (within schools and districts) and at the micro level (inside a student's brain); \* Effective strategies from those who have succeeded and ways to replicate those best practices at your own school; and \* How to engage the resources necessary to make change happen. Too often, we talk about change while maintaining a culture of excuses. We can do better. Although no magic bullet can offset the grave challenges faced daily by disadvantaged children, this timely resource shines a spotlight on what matters most, providing an inspiring and practical guide for enriching the minds and lives of all your students.

*Mapping the Mind* Lawrence A. Hirschfeld,Susan A. Gelman,1994-04-29 A collection of essays introducing the reader to 'domain-specificity'.

**Emotions of Animals and Humans** Shigeru Watanabe,Stan Kuczaj,2012-08-31 This book takes a multidisciplinary approach to emotion, with contributions from biologists, psychologists, neuroscientists, robot engineers, and artists. A wide range of emotional phenomena is discussed, including the notion that humans' sophisticated sensibility, as evidenced by our aesthetic appreciation of the arts, is based at least in part on a basic emotional sensibility that is found in young children and perhaps even some non-human animal species. As a result, this book comprises a unique comparative perspective on the study of emotion. A number of chapters consider emotions in a variety of animal groups, including fish, birds, and mammals. Other chapters expand the scope of the book to humans and robots. Specific topics covered in these chapters run the gamut from lower-level emotional activity, such as emotional expression, to higher-level emotional activity, such as altruism, love, and aesthetics. Taken as a whole, the book presents manifold perspectives on emotion and provides a solid foundation for future multidisciplinary research on the nature of emotions.

Human Movements in Human-Computer Interaction (HCI) Cezary Biele,2021-12-01 This book discusses human-computer interaction (HCI) which is a multidisciplinary field of study which aims at developing and implementing tools and techniques to attain an effective and efficient interaction between the humans (the users) and computers. In recent years, there is an increase of interest of HCI researchers and practitioners in the inclusion of gaze gestures which can greatly enhance the communication between the human user and the computer, as well as other more "physical" communication involving all what can be learned from movements of the human body, from face, hand, leg, foot, etc., to the whole body movement, even extending to the involvement of groups of agents, even society. These explicitly human-centric issues in the development, design, analysis, and implementation of the HCI systems are discussed in the book. A comprehensive state of the art is given complemented with original own proposals. As opposed to more traditional formal and IT based analyses, the discussion is here more focused on relevant research results from psychology and psychophysiology, and other soft, cognitive, etc., sciences. Remarks on the relevance of affective computing are also mentioned.

*Computer-Mediated Communication* Caleb T. Carr,2021-04-29 Caleb T. Carr introduces students to fundamental concepts, theories, and applications of computer-mediated

*A Cultural History of the Emotions in the Baroque and Enlightenment Age*, 2020-08-20 During the period of the Baroque and Enlightenment the word “emotion”, denoting passions and feelings, came into usage, albeit in an irregular fashion. “Emotion” ultimately emerged as a term in its own right, and evolved in English from meaning physical agitation to describe mental feeling. However, the older terminology of “passions” and “affections” continued as the dominant discourse structuring thinking about feeling and its wider religious, political, social, economic, and moral imperatives. The emotional cultures described in these essays enable some comparative discussion about the history of emotions, and particularly the causes and consequences of emotional change in the larger cultural contexts of the Baroque and Enlightenment. Emotions research has enabled a rethinking of dominant narratives of the period-of histories of revolution, state-building, the rise of the public sphere, religious and scientific transformation, and more. As a new and dynamic field, the essays here are just the beginning of a much bigger history of emotions.

**Great Pianists on Piano Playing** James Francis Cooke, 1917

*Research and Development in Intelligent Systems XXVI* Richard Ellis, Miltos Petridis, 2009-10-28 The most common document formalisation for text classification is the vector space model founded on the bag of words/phrases representation. The main advantage of the vector space model is that it can readily be employed by classification algorithms. However, the bag of words/phrases representation is suited to capturing only word/phrase frequency; structural and semantic information is ignored. It has been established that structural information plays an important role in classification accuracy [14]. An alternative to the bag of words/phrases representation is a graph based representation, which intuitively possesses much more expressive power. However, this representation introduces an additional level of complexity in that the calculation of the similarity between two graphs is significantly more computationally expensive than between two vectors (see for example [16]). Some work (see for example [12]) has been done on hybrid representations to capture both structural elements (using the graph model) and significant features using the vector model. However the computational resources required to process this hybrid model are still extensive.
