Vittorio Bertocci

## **A Guide to Claims-based Identity and Access**

**Control** Dominick Baier, Vittorio Bertocci, Keith

Brown, Matias Woloski, Eugenio Pace, 2010 As systems

have become interconnected and more complicated, programmers needed ways to identify parties across

multiple computers. One way to do this was for the parties that used applications on one computer to

authenticate to the applications (and/or operating systems) that ran on the other computers. This

mechanism is still widely used-for example, when logging on to a great number of Web sites.

However, this approach becomes unmanageable when you have many co-operating systems (as is the

case, for example, in the enterprise). Therefore, specialized services were invented that would

register and authenticate users, and subsequently provide claims about them to interested

applications. Some well-known examples are NTLM, Kerberos, Public Key Infrastructure (PKI), and the

Security Assertion Markup Language (SAML). Most enterprise applications need some basic user

security features. At a minimum, they need to authenticate their users, and many also need to

authorize access to certain features so that only privileged users can get to them. Some apps must

go further and audit what the user does. On Windows®, these features are built into the

operating system and are usually quite easy to integrate into an application. By taking advantage

of Windows integrated authentication, you don't have to invent your own authentication protocol or

manage a user database. By using access control lists (ACLs), impersonation, and features such as

groups, you can implement authorization with very little code. Indeed, this advice applies no matter which OS you are using. It's almost always a better idea to integrate closely with the security features in your OS rather than reinventing those features yourself. But what happens when you want to extend reach to users who don't happen to have Windows accounts? What about users who aren't running Windows at all? More and more applications need this type of reach, which seems to fly in the face of traditional advice. This book gives you enough information to evaluate claims-based identity as a possible option when you're planning a new application or making changes to an existing one. It is intended for any architect, developer, or information technology (IT) professional who designs, builds, or operates Web applications and services that require identity information about their users.

**Modern Authentication with Azure Active Directory for Web Applications** Vittorio Bertocci, 2015-12-17 Build advanced authentication solutions for any cloud or web environment Active Directory has been transformed to reflect the cloud revolution, modern protocols, and today's newest SaaS paradigms. This is an authoritative, deep-dive guide to building Active Directory authentication solutions for these new environments. Author Vittorio Bertocci drove these technologies from initial concept to general availability, playing key roles in everything from technical design to documentation. In this book, he delivers comprehensive guidance for building complete solutions. For each app type, Bertocci

presents high-level scenarios and quick implementation steps, illuminates key concepts in greater depth, and helps you refine your solution to improve performance and reliability. He helps you make sense of highly abstract architectural diagrams and nitty-gritty protocol and implementation details. This is the book for people motivated to become experts. Active Directory Program Manager Vittorio Bertocci shows you how to: Address authentication challenges in the cloud or on-premises Systematically protect apps with Azure AD and AD Federation Services Power sign-in flows with OpenID Connect, Azure AD, and AD libraries Make the most of OpenID Connect's middleware and supporting classes Work with the Azure AD representation of apps and their relationships Provide fine-grained app access control via roles, groups, and permissions Consume and expose Web APIs protected by Azure AD Understand new authentication protocols without reading complex spec documents
