Native Evangelism in Central Mexico Hugo G. Nutini,Jean F. Nutini,2014-08-15 Evangelical Christianity is Mexico's fastest-growing religious movement, with about ten million adherents today. Most belong to Protestant denominations introduced from the United States (e.g., Jehovah's Witnesses, Seventh-day Adventists), but perhaps as many as 800,000 are members of homegrown, native evangelical sects. These native Mexican sects share much with the American denominations of which they are spinoffs. For instance, they are Trinitarian, Anabaptist, and Millenarian; they emphasize a personal relationship with God, totally rejecting intercession by saints; and they insist that they are the only true Christians. Beyond that, each native sect has its distinctive characteristics. This book focuses on two sharply contrastive native evangelical sects in Central Mexico: Amistad y Vida (Friendship and Life) and La Luz del Mundo (The Light of the World). The former, founded in 1982, now has perhaps 120,000 adherents nationwide. It is nonhierarchical, extremely egalitarian, and has no dogmatic directives. It is a cheerful religion that emphasizes charity, community service, and personal kindness as the path to salvation. It attracts new members, mainly from the urban middle class, through personal example rather than proselytizing. La Luz del Mundo, founded in 1926, now has about 350,000 members in Mexico and perhaps one million in the hemisphere. It is hierarchically organized and demands total devotion to the sect's founder and his son, who are seen as direct links to Jesus on Earth. It is a proselytizing sect that recruits mainly among the urban poor by providing economic benefits within the congregations, but does no community service as such. Based on ten years of fieldwork (1996–2006) and contextualized by nearly fifty years of anthropological study in the region, Native Evangelism in Central Mexico presents the first ethnography of Mexico's native evangelical congregations.

"I Undertook Great Works" Douglas J. Green,2010 Traditionally, scholars study ancient Near Eastern royal inscriptions to reconstruct the events they narrate. In recent decades, however, a new approach has analyzed these inscriptions as products of royal ideology and has delineated the way that ideology has shaped their narration of historical events. This ideologically-sensitive approach has focused on kings' accounts of their military campaigns. This study applies this approach to the narration of royal domestic achievements, first in the Neo-Assyrian inscriptional tradition, but especially in nine West Semitic inscriptions from the 10th to 7th centuries B.C.E. and describes how these accounts also function as the products of royal ideology.

The Book Before Printing David Diringer, 2013-01-17 A remarkable work. . . . For sheer weight of information there is no equal to it. — The Spectator. It is probable that the earliest books were written on wood or leaves as early as the fourth millennium B.C. These fragile materials, unfortunately, have not come down to us. In their absence, the earliest surviving books are the clay tablets of Mesopotamia, the oldest attributed to c. 3500 B.C. On these ancient clay shards, dense rows of cuneiform script record the seminal writings of mankind: the Gilgamesh epic, Sumerian literary catalogues, Babylonian astrology, Assyrian accounts of the Creation and the Flood, and the Lipit-Ishtar Law-Code (c. 2000 B.C.), predating Hammurabi and the oldest law code in human history. Probably as ancient as the Mesopotamian writings, or nearly so, are Egyptian hieroglyphics. In a sense, it is the papyrus scrolls of the Egyptians — preserved by that country's hot, dry climate — that represent the true ancestors of the modern book. As the centuries passed, papyrus slowly gave way to parchment (the prepared skins of animals) as writing material. Indeed, the handwritten parchment or

vellum codex is the book par excellence of the Middle Ages. Western European book production is only part of the story, and the author is at pains to illuminate the bibliographic contributions of numerous peoples and cultures: Greek and Roman book production, books made in central and southern Asia, the books of Africa, pre-Columbian America, and the Far East – material that is often not mentioned in Western histories of the book. Based on years of painstaking research and incorporating a wealth of new material and conclusions, the text is enhanced throughout by abundant illustrations – nearly 200 photographic facsimiles of priceless manuscripts in museums and libraries around the world.

Advances in Mathematical Economics Volume 18 Shigeo Kusuoka,Toru Maruyama,2014-06-07 A lot of economic problems can be formulated as constrained optimizations and equilibration of their solutions. Various mathematical theories have been supplying economists with indispensable machineries for these problems arising in economic theory. Conversely, mathematicians have been stimulated by various mathematical difficulties raised by economic theories. The series is designed to bring together those mathematicians who are seriously interested in getting new challenging stimuli from economic theories with those economists who are seeking effective mathematical tools for their research.

Modeling and Inverse Problems in the Presence of Uncertainty H. T. Banks, Shuhua Hu, W. Clayton Thompson, 2014-04-01 Modeling and Inverse Problems in the Presence of Uncertainty collects recent research—including the authors' own substantial projects—on uncertainty propagation and quantification. It covers two sources of uncertainty: where uncertainty is present primarily due to measurement errors and where uncertainty is present due to the modeling formulation itself. After a useful review of relevant probability and statistical concepts, the book summarizes mathematical and statistical aspects of inverse problem methodology, including ordinary, weighted, and generalized least-squares formulations. It then discusses asymptotic theories, bootstrapping, and issues related to the evaluation of correctness of assumed form of statistical models. The authors go on to present methods for evaluating and comparing the validity of appropriateness of a collection of models for describing a given data set, including statistically based model selection and comparison techniques. They also explore recent results on the estimation of probability distributions when they are embedded in complex mathematical models and only aggregate (not individual) data are available. In addition, they briefly discuss the optimal design of experiments in support of inverse problems for given models. The book concludes with a focus on uncertainty in model formulation itself, covering the general relationship of differential equations driven by white noise and the ones driven by colored noise in terms of their resulting probability density functions. It also deals with questions related to the appropriateness of discrete versus continuum models in transitions from small to large numbers of individuals. With many examples throughout addressing problems in physics, biology, and other areas, this book is intended for applied mathematicians interested in deterministic and/or stochastic models and their interactions. It is also suitable for scientists in biology, medicine, engineering, and physics working on basic modeling and inverse problems, uncertainty in modeling, propagation of uncertainty, and statistical modeling.

Exact and Approximate Modeling of Linear Systems Ivan Markovsky, Jan C. Willems, Sabine Van Huffel, Bart De Moor, 2006-01-01 This title elegantly introduces the behavioral approach to mathematical modeling, an approach that requires models to be viewed as sets of possible outcomes rather than to be a priori bound to particular representations. The authors discuss exact and approximate fitting of data by linear, bilinear, and quadratic static models and linear dynamic models, a formulation that enables readers to select the most suitable representation for a particular purpose. This book presents exact subspace-type and approximate optimization-based identification methods, as well as representation-free problem formulations, an

overview of solution approaches, and software implementation. Readers will find an exposition of a wide variety of modeling problems starting from observed data. The presented theory leads to algorithms that are implemented in C language and in MATLAB.
