Mobile Security Products for Android Philipp Kratzer,Christoph Gruber,Andreas Clementi,David Lahee,Philippe Rödlach,Peter Stelzhammer,2014-10-14 We have once again tested security products for smartphones running Google's Android operating system. Our report covers details of the products made by leading manufacturers. Smartphones represent the future of modern communications. In 2013, more than 1 billion smartphones were sold, a further milestone in the advance of these devices¹. A study published by Facebook emphasises the importance of smartphones in our lives; about 80% of users make use of their smartphone within 15 minutes of waking up each day. At the same time, the traditional function of a telephone is becoming less and less important. The high quality of integrated cameras means that the smartphone is increasingly used for photography. As well as with photos, users trust their devices with their most personal communications, such as Facebook, WhatsApp and email. This brings some risks with it, as such usage makes the smartphone interesting for criminals, who attempt to infect the device with malware or steal personal data. There is also the danger brought by phishing attacks. These days, the use of security software on a PC or laptop is seen as essential. However, many smartphone users do not yet have the same sense of responsibility, even though their devices store personal data, private photos, Internet banking information or even company data. As modern smartphones are often expensive to buy, they are also an attractive target for thieves. Top-quality smartphones cost several hundred Euros. As it is not possible to physically prevent them from being stolen, they must be made less attractive to thieves. Consequently, many of today's security products contain not only malware protection, but also highly developed theft-protection functions, which make the device less attractive to thieves (e.g. by locking the device), and help the owner to find it again.

Bulletproof Android Godfrey Nolan,2014-11-18 Battle-Tested Best Practices for Securing Android Apps throughout the Development Lifecycle Android's immense popularity has made it today's #1 target for attack: high-profile victims include eHarmony, Facebook, and Delta Airlines, just to name a few. Today, every Android app needs to resist aggressive attacks and protect data, and in Bulletproof Android™, Godfrey Nolan shows you how. Unlike "black hat/gray hat" books, which focus on breaking code, this guide brings together complete best practices for hardening code throughout the entire development lifecycle. Using detailed examples from hundreds of apps he has personally audited, Nolan identifies common "anti-patterns" that expose apps to attack, and then demonstrates more secure solutions. Nolan covers authentication, networking, databases, server attacks, libraries, hardware, and more. He illuminates each technique with code examples, offering expert advice on implementation and trade-offs. Each topic is supported with a complete sample app, which demonstrates real security problems and solutions. Learn how to Apply core practices for securing the platform Protect code, algorithms, and business rules from reverse engineering Eliminate hardcoding of keys, APIs, and other static data Eradicate extraneous data from production APKs Overcome the unique challenges of mobile authentication and login Transmit information securely using SSL Prevent man-in-the-middle attacks Safely store data in SQLite databases Prevent attacks against web servers and services Avoid side-channel data leakage through third-party libraries Secure APKs running on diverse devices and Android versions Achieve HIPAA or FIPS compliance Harden devices with encryption, SELinux, Knox, and MDM Preview emerging attacks and countermeasures This guide is a perfect complement to Nolan's Android™ Security Essentials LiveLessons (video training; ISBN-13: 978-0-13-382904-4) and reflects new risks that have been identified since the LiveLessons were released.

Android Security Internals Nikolay Elenkov,2014-10-14 There are more than one billion Android devices in use today, each one a potential target. Differences Between the Security Models of Android and iOS Samuel Hopstock,2019-07-24 Seminar paper from the year 2018 in the subject Computer Science - IT-Security, grade: 1,0, Technical University of Munich, course: Seminar Mobile Application Security, language: English, abstract: Smartphones are being used as the preferred device for as many things as possible in today's world. This is why having secure phones that are resilient against attacks targeting their users' data, becomes more and more important. This paper tries to assess what measures device vendors have taken to ensure those attacks will not be successful. Because the market is mostly divided between Google's Android and Apple's iOS, we put our focus on those two operating systems and compare their respective security models. Additionally this comparison will be evaluating how those models have changed over time since the beginning of the smartphone era around 2010. The last part of this analysis will take a look at a different view on smartphones, the perspective of so-called power users: Those are people that do not only use their smartphone for downloading some apps and surfing the Internet but rather want to do some lower-level customization to the operating system, by rooting their Android device or jailbreaking their iPhone. This process of gaining full privileges on the phone not only creates advantages for the user but can also have rather negative implications on the device's security. How exactly does this affect the protections implemented by the vendor?

Mobile Device Data Security on Android Asim Kumar Sen, Bhavesh Pandya, N. D. Junnarkar, 2015-11-04 Smart phones and other mobile devices are widely used in day to day life. One of the important feature of mobile devices is mobility, which exposes them to different threat environments and excludes them from relying on external physical security. So, the security requirements for mobile devices are different from stationary machines. The enterprises, government, and military uses various productive applications. Productive applications often deal with sensitive and secret data. A risk management and security framework is required to protect applications and data on mobile devices. Application lockbox provides another layer of protection for sensitive applications and data in mobile devices. Lockbox has ability to lockout sensitive applications and data. If the lockbox is locked, applications and data inside it should be protected from the attacks on operating system and physical attacks. It will encapsulate individual applications and all their associated data to allow for access control on the application level. It can provide meaningful protection without significant changes in current technology.
