What We Need to Do Now Chris Goodall,2020-02-06
The UK has declared a 'climate emergency' and pledged to become carbon neutral by 2050. So how do we get there? Drawing on actions, policies and technologies already emerging around the world, Chris Goodall sets out the ways to achieve this. His proposals include: -Building a huge over-capacity of wind and solar energy, storing the excess as hydrogen. -Using hydrogen to fuel our trains, shipping, boilers and heavy industry, while electrifying buses, trucks and cars. -Farming - and eating - differently, encouraging plant-based alternatives to meat -paying farmers to plant and maintain woodlands. -Making fashion sustainable and aviation pay its way, funding synthetic fuels and genuine offsets. -Using technical solutions to capture CO2 from the air, and biochar to lock carbon in the soil. What We Need To Do Now is an urgent, practical and inspiring book that signals a green new deal for Britain.

Carbon Inventory Methods N.H. Ravindranath,Madelene Ostwald,2007-12-03 Carbon Inventory Methods Handbook fills the need for a handbook that provides guidelines and methods required for carbon inventory. It provides detailed step-by-step information on sampling procedures, field and laboratory measurements, application of remote sensing and GIS techniques, modeling, and calculation procedures along with sources of

data for carbon inventory. The book is driven by a growing need for 'carbon inventory' for land use sections such as forests.

The Global Carbon Crisis Timo Busch, Paul

Shrivastava, 2017-09-08 For at least a decade the science of climate change has warned us of the dire need for action – particularly by corporations who are the main engines of economic production and consumption. Yet managerial and corporate understanding of climate change and related energy issues remains fragmented and present actions lack the urgency this critical problem deserves. There is a whole new economy – the low-carbon economy – looming on the horizon. But our consumption and production patterns remain in a carbon-locked position. What we are risking is a global carbon crisis and a case of history repeating. Humankind's failure to adequately recognise the onset of and address the effects of the global financial crisis mirrors our similar failures with the carbon crisis. There are many parallels: both are and were predictable and both will have direct implications on humanity on a sweeping, indiscriminate and severe scale. The difference is that we cannot reverse the effects of climate change and fossil fuel scarcity as easily as we can repair the global financial system. It is of paramount importance that we wake up to the risks and begin tackling the issues early enough. To successfully address the risks, business needs to be aware of the consequences that a changing climate and finite carbon resources will have on their business performance. The element carbon – both as a resource and as an emission – is both an economic threat as well as an opportunity for companies. It is a threat for carbon-intense production systems that will need to be changed to avoid further harmful climatic change, and take into account the limited availability of carbon-based fuels. At the same time,

new opportunities will emerge for companies who can creatively design and produce goods and services that fit the new emerging carbon-constrained business environment. Many sectors of the economy – for example, renewable energy, energy and resources conservation, waste reduction and management, carbon finance markets – will expand rapidly, as other carbon- and resource-intensive sectors decline. The Global Carbon Crisis succinctly translates important insights from the natural sciences, economics and equity discussions, for the business reader. It reviews important aspects of these discussions and clarifies misunderstandings with respect to climate change and fossil fuel availability and their implications for business. The book provides simple, direct, pragmatic and effective solutions that policy-makers and corporate managers can implement. The aim is to provoke action – thoughtful action – towards developing a low-carbon future for companies on three levels. At the macro level, the authors discuss the importance of tough industrial policies for climate change and propose the idea of an international carbon-equal fund. At the meso level, they elaborate on the role of inter-firm collaborations for establishing low-carbon industries and production systems. At the micro level, they illustrate the virtue of proactive carbon strategies and suggest a corporate carbon management framework. Getting the message of the carbon crisis across to a business audience has proved challenging. This book successfully makes the case that they are intricately connected to one another and practising managers and business students will benefit from viewing the carbon crisis in parallel to the financial meltdown. The book will be essential reading for all businesses grappling with carbon-related issues and for many in academia, including those in management,

strategy, finance, corporate social responsibility and sustainable development, globalisation and innovation studies.

The Carbon Almanac The Carbon Almanac Network,2022-07-12 When it comes to the climate, we don't need more marketing or anxiety. We need established facts and a plan for collective action. The climate is the fundamental issue of our time, and now we face a critical decision. Whether to be optimistic or fatalistic, whether to profess skepticism or to take action. Yet it seems we can barely agree on what is really going on, let alone what needs to be done. We urgently need facts, not opinions. Insights, not statistics. And a shift from thinking about climate change as a "me" problem to a "we" problem. The Carbon Almanac is a once-in-a-lifetime collaboration between hundreds of writers, researchers, thinkers, and illustrators that focuses on what we know, what has come before, and what might happen next. Drawing on over 1,000 data points, the book uses cartoons, quotes, illustrations, tables, histories, and articles to lay out carbon's impact on our food system, ocean acidity, agriculture, energy, biodiversity, extreme weather events, the economy, human health, and best and worst-case scenarios. Visually engaging and built to share, The Carbon Almanac is the definitive source for facts and the basis for a global movement to fight climate change. This isn't what the oil companies, marketers, activists, or politicians want you to believe. This is what's really happening, right now. Our planet is in trouble, and no one concerned group, corporation, country, or hemisphere can address this on its own. Self-interest only increases the problem. We are in this together. And it's not too late for concerted, collective action for change.

Climate Crisis. How to Save the World from Ourselves Saygin Celen, Existential Threat. Climate change is the biggest existential crisis that humankind has faced. In the last 100 years, we have ruined the carbon cycle using fossil fuels, namely, coal, petroleum, and natural gas to build our civilization not taking into account the catastrophic impacts of climate change can cause. We are already seeing a record of floods, hurricanes, wildfires and droughts since the temperature rise is already at 1.5 degrees Celsius. We need to reduce our greenhouse effect by half by 2030 and reach the zero-carbon economy by 2050 to limit the temperature rise to 2 degrees Celsius. Even though our lives depend on it, most of us don't know about the causes and how we will be able to tackle this existential threat. This book gives you alternative answers on what steps governments, companies and individuals need to take. Greenhouse Effects and Global Warming. According to Elon Musk: Ruining the carbon cycle is the dumbest experiment in history. Life on earth built its balance in 4.5 billion years, and human-induced fossil fuel emissions caused the carbon dioxide density to increase from 300 to 420 ppm in less than 100 years resulting in the heat to be trapped in the atmosphere, and the average

temperature to increase 1.5 degrees Celsius. We need to keep it at 2 degrees Celsius level. The Biggest Opportunity. We are at a turning point. Climate change solutions also make economical sense, which is what governments, and corporations are completely aware. Now is the time to phase out the fossil fuel production and consumption and gain full momentum to the green zero-carbon economy such as geothermal, wind power, solar electricity, nuclear fusion, and biomass. Fortunately, renewable sources along with the available technologies, and upcoming innovations are all in line to create the sustainable future economy.

Successful Models. Arguably, the biggest challenge that the humanity has ever overcome as one species is the Ozone depletion through the Montreal Protocol, which was signed by 197 countries. Now, the Ozone layer is fully recovering as chlorofluorocarbons are banned by all countries, and it's estimated to fully recover by 2050. The Montreal Treaty and other successful technologies and innovations can be used as a success model that also represents what we are able to achieve when we unite. The New Economy. It's inevitable that we will be feeling the impacts of climate change for the decades to come since we keep filling the atmosphere with greenhouse gases. However, we have every reason to be extremely hopeful since all the countries signed the Paris Agreement, they come together each year to improve the progress via COP meetings, and we have new, and upcoming technologies such as Tokamak nuclear fusion, solid state batteries, complete electrification of vehicles, and concentrated solar power that can realize the zero-carbon economy by the 2050 deadline. Learn what climate change exactly is and how we will be able to tackle it in the next few decades. This book will bring you the information and insight for you to see how governments, companies and individuals can

take orchestrated actions.

Rise and Fall of the Carbon Civilisation Patrick Moriarty, Damon Honnery, 2010-10-27 A vast amount has been written on climate change and what should be our response. Rise and Fall of the Carbon Civilisation suggests that most of this literature takes a far too optimistic position regarding the potential for conventional mitigation solutions to achieve the deep cuts in greenhouse gases necessary in the limited time frame we have available. In addition, global environmental problems, as exemplified by climate change, and global resource problems – such as fossil fuel depletion or fresh water scarcity – have largely been seen as separate issues. Further, proposals for solution of these problems often focus at the national level, when the problems are global. The authors argue that the various challenges the planet faces are both serious and interconnected. Rise and Fall of the Carbon Civilisation takes a global perspective in its treatment of various solutions: • renewable energy; • nuclear energy; • energy efficiency; • carbon sequestration; and • geo-engineering. It also addresses the possibility that realistic solutions cannot be achieved until the fundamentally ethical question of global equity – both across nations today and also inter-generational – is fully addressed. Such an approach will also involve reorienting the global economy away from an emphasis on growth and toward the direct satisfaction of basic human needs for all the Earth's people. Rise and Fall of the Carbon Civilisation is aimed at the many members of the public with an awareness of climate change, but who wish to find out more about how we need to respond to the challenge. It will also be of interest to technical professionals, as well as postgraduate students and researchers, from the environmental and engineering science sectors.

Burn Albert Bates, Kathleen Draper, 2020-04-14 In order to rescue ourselves from climate catastrophe, we need to radically alter how humans live on Earth. We have to go from spending carbon to banking it. We have to put back the trees, wetlands, and corals. We have to regrow the soil and turn back the desert. We have to save whales, wombats, and wolves. We have to reverse the flow of greenhouse gases and send them in exactly the opposite direction: down, not up. We have to flip the carbon cycle and run it backwards. For such a revolutionary transformation we'll need civilization 2.0. A secret unlocked by the ancients of the Amazon for its ability to transform impoverished tropical soils into terra preta—fertile black earths—points the way. The indigenous custom of converting organic materials into long lasting carbon has enjoyed a reawakening in recent decades as the quest for more sustainable farming methods has grown. Yet the benefits of this carbonized material, now called biochar, extend far beyond the soil. Pyrolyzing carbon has the power to restore a natural balance by unmining the coal and undrilling the oil and gas. Employed to its full potential, it can run the carbon cycle in reverse and remake Earth as a garden planet. Burn looks beyond renewable biomass or carbon capture energy systems to offer a bigger and bolder vision for the next phase of human progress, moving carbon from wasted sources: • into soils and agricultural systems to rebalance the carbon, nitrogen, and related cycles; enhance nutrient density in food; rebuild topsoil; and condition urban and agricultural lands to withstand flooding and drought • to cleanse water by carbon filtration and trophic cascades within the world's rivers, oceans, and wetlands • to shift urban infrastructures such as buildings, roads, bridges, and ports, incorporating drawdown materials and components,

replacing steel, concrete, polymers, and composites with biological carbon • to drive economic reorganization by incentivizing carbon drawdown Fully developed, this approach costs nothing—to the contrary, it can save companies money or provide new revenue streams. It contains the seeds of a new, circular economy in which energy, natural resources, and human ingenuity enter a virtuous cycle of improvement. Burn offers bold new solutions to climate change that can begin right now.

Designing Climate Solutions Hal Harvey, Robbie Orvis, Jeffrey Rissman, 2018-11-01 With the effects of climate change already upon us, the need to cut global greenhouse gas emissions is nothing less than urgent. It's a daunting challenge, but the technologies and strategies to meet it exist today. A small set of energy policies, designed and implemented well, can put us on the path to a low carbon future. Energy systems are large and complex, so energy policy must be focused and cost-effective. One-size-fits-all approaches simply won't get the job done. Policymakers need a clear, comprehensive resource that outlines the energy policies that will have the biggest impact on our climate future, and describes how to design these policies well. *Designing Climate Solutions: A Policy Guide for Low-Carbon Energy* is the first such guide, bringing together the latest research and analysis around low carbon energy solutions. Written by Hal Harvey, CEO of the policy firm Energy Innovation, with Robbie Orvis and Jeffrey Rissman of Energy Innovation, *Designing Climate Solutions* is an accessible resource on lowering carbon emissions for policymakers, activists, philanthropists, and others in the climate and energy community. In Part I, the authors deliver a roadmap for understanding which countries, sectors, and sources produce the greatest amount of greenhouse gas emissions, and give readers the

tools to select and design efficient policies for each of these sectors. In Part II, they break down each type of policy, from renewable portfolio standards to carbon pricing, offering key design principles and case studies where each policy has been implemented successfully. We don't need to wait for new technologies or strategies to create a low carbon future—and we can't afford to. Designing Climate Solutions gives professionals the tools they need to select, design, and implement the policies that can put us on the path to a livable climate future.

Net Zero DIETER. HELM, James Eden, 2020-08-20

What can we really do about the climate emergency? The inconvenient truth is that we are causing the climate crisis with our carbon intensive lifestyles and that fixing - or even just slowing - it will affect all of us. But it can be done. In *Net Zero*, economist Dieter Helm addresses the action we all need to take to tackle the climate emergency: personal, local, national and global. Reducing our own carbon consumption is the first step. Helm argues that we, the ultimate polluters, should pay based on how much carbon the products we buy produce. We need a carbon price, and one that applies to everything and everywhere, from flights, to food and farming. The goal of net zero carbon emissions needs a rethink and this book sets out how to do it in a plan that could and would work. Do this and we make no further contribution to global warming, in a way that embraces sustainable economic growth and does not harm other aspects of the environment in the process. There is a solution and we must find it. Everything is at stake.

Cars and Carbon Theodoros I. Zachariadis, 2011-11-19

This volume contains articles from leading analysts and researchers on sustainable transportation, who provide critical reflections on how automobile-related climate

policies have evolved up to now in Europe and around the world, in view of the widely recognized need to substantially curb global emissions of greenhouse gases in the coming decades. Authors describe the policies which have been most effective, outline their economic and social implications, present success stories while critically reviewing less successful examples, and suggest strategies to decarbonize passenger transportation on a global scale.

The Climate Diet Paul Greenberg, 2021-04-13 “Useful and relevant. . . . Greenberg’s writing is clear and concise. Each section starts with easy tips . . . then wades into bigger, trickier concepts.” —New York Times Book Review A celebrated writer on food and sustainability offers fifty straightforward, impactful rules for climate-friendly living We all understand just how dire the circumstances facing our planet are and that we all need to do our part to stem the tide of climate change. When we look in the mirror, we can admit that we desperately need to go on a climate diet. But the task of cutting down our carbon emissions feels overwhelming and the discipline required hard to summon. With *The Climate Diet*, award-winning food and environmental writer Paul Greenberg offers us the practical, accessible guide we all need. It contains fifty achievable steps we can take to live our daily lives in a way that's friendlier to the planet--from what we eat, how we live at home, how we travel, and how we lobby businesses and elected officials to do the right thing. Chock-full of simple yet revelatory guidance, *The Climate Diet* empowers us to cast aside feelings of helplessness and start making positive changes for the good of our planet.

Capturing Carbon Robin M. Mills, 2011 We now possess the technology to capture carbon emissions as they are released into the atmosphere. After capture, the gas is trapped within facilities hidden far underground. As

promising as this process sounds, can it really compete with the often cheaper, low-carbon technologies currently available, and is the practice really safe and eco-friendly? Furthermore, will governments and societies embrace this controversial method and integrate it fully into their economic markets? Capturing Carbon is one of the first books to seriously evaluate this issue, describing the need for this new technology and the components that make it work. Robin M. Mills, a longtime energy professional with a background in geology and economics, paints an accessible portrait of carbon capture's existing and projected technologies. He covers the specifics of geological storage and, interestingly, compares it to the biological sequestering of carbon occurring naturally in soils and forests. With a frank and unbiased analysis, Mills considers the costs of this process and its value in curbing climate change. He tackles the politics and policies that will help the technology take root, and he anticipates the public's reaction and opportunities for business. Mills also accounts for the risks of carbon capture, rounding out a definitive and all-encompassing volume for environmentalists, policymakers, investors, industry insiders, and anyone wishing to understand these new developments.

Carbon Footprint Case Studies Subramanian Senthilkannan Muthu, 2020-12-02 Global warming and its effects are felt and understood by almost every one across the globe now. Carbon footprint calculation and mitigation in different industrial sectors is the need of the hour. There are numerous industrial sectors, whose carbon footprints need to be calculated and the ways to mitigate the greenhouse gas emissions from those sectors need to be started with immediate effect. This book highlights case studies involving the carbon footprints of municipal solid

waste, sustainable road transport and Carbon footprint accounting of sources and sinks by studying carbon sequestration of Karnataka, a state in India.

Summary of How to Avoid a Climate Disaster

Alexander Cooper, 2021-04-05 Summary of How to Avoid a Climate Disaster There are two numbers you need to know when it comes to understanding climate change. The first is fifty billion—the number of greenhouse gases we release into the atmosphere. The second is zero—the number of greenhouse gases we need to release in the atmosphere to avoid catastrophic climate change problems. By working together, Gates thinks we can reach these lofty goals. Gates began by looking at per-capita income as it related to energy uses and found that the higher the per capita income of a country, the higher the amount of energy that country used. Since energy consumption equaled about 27% of the greenhouse gases emitting, this would be an important part of the puzzle—but it wouldn't be the only part. Gates developed three beliefs about energy consumption and climate change. First, to avoid a climate disaster we have to get down to zero greenhouse gases. Second, we need to employ the tools we have (like wind and solar energy) smarter and faster. Third, we need to find new technology that can take us the rest of the way. To solve the energy crisis, we have to start by investing in clean energy and getting money out of the fuel, oil, and coal industries. Money speaks, and if we can make it so that it's financially beneficial to switch to clean energy, then we may see those greenhouse gases eliminated. For a long time, people have said that we need to fly and drive less to decrease the number of greenhouse gases that enter our atmosphere. However, as the COVID-19 pandemic hit globally, we found people doing just that, but our rates of carbon emissions only went down about 5%.

This would be a significant amount of it was sustainable and each year saw similar decreases, however, it is not significant enough to prevent climate disasters. This book will not only tell you how to best use the energy you have and how to create clean energy in your homes, but it will also tell you what plans to follow to help prevent disastrous climate change and some of the newest technological ideas that are primed to help make a huge difference. Climate Intervention National Research

Council, Division on Earth and Life Studies, Ocean Studies Board, Board on Atmospheric Sciences and

Climate, Committee on Geoengineering Climate: Technical Evaluation and Discussion of Impacts, 2015-06-17 The signals are everywhere that our planet is experiencing significant climate change. It is clear that we need to

reduce the emissions of carbon dioxide and other greenhouse gases from our atmosphere if we want to avoid greatly increased risk of damage from climate change.

Aggressively pursuing a program of emissions abatement or mitigation will show results over a timescale of many decades. How do we actively remove carbon dioxide from the atmosphere to make a bigger difference more quickly?

As one of a two-book report, this volume of *Climate Intervention* discusses CDR, the carbon dioxide removal of greenhouse gas emissions from the atmosphere and sequestration of it in perpetuity. *Climate Intervention:*

Carbon Dioxide Removal and Reliable Sequestration

introduces possible CDR approaches and then discusses them in depth. Land management practices, such as low-till agriculture, reforestation and afforestation, ocean iron

fertilization, and land-and-ocean-based accelerated weathering, could amplify the rates of processes that are already occurring as part of the natural carbon cycle. Other CDR approaches, such as bioenergy with carbon capture and sequestration, direct air capture and sequestration, and traditional carbon capture and sequestration, seek to capture CO₂ from the atmosphere and dispose of it by pumping it underground at high pressure. This book looks at the pros and cons of these options and estimates possible rates of removal and total amounts that might be removed via these methods. With whatever portfolio of technologies the transition is achieved, eliminating the carbon dioxide emissions from the global energy and transportation systems will pose an enormous technical, economic, and social challenge that will likely take decades of concerted effort to achieve. *Climate Intervention: Carbon Dioxide Removal and Reliable Sequestration* will help to better understand the potential cost and performance of CDR strategies to inform debate and decision making as we work to stabilize and reduce atmospheric concentrations of carbon dioxide.

Hydrogen Production and Remediation of Carbon and Pollutants Eric Lichtfouse, Jan Schwarzbauer, Didier Robert, 2015-09-09 This book details first the chemistry of hydrogen production from biomass. Solutions to the CO₂ issue are given in three chapters, which describe CO₂ photo catalytic reduction, CO₂ sequestration in terrestrial biomass, and plants as renewable fuels. Further chapters review the selenium cycle in ecosystems, advanced processes to treat water and ecological ways to dye textiles. Society growth during the last century has almost entirely relied on the carbon economy, which is the use of fossil fuels for energy and materials. The carbon economy has provided and will still provide many benefits. However,

the increasing use of fossil fuels is partly responsible for the increase of atmospheric CO₂ concentrations and in turn, global warming. There is therefore an urgent need for cleaner fuels such as hydrogen, as well as a need for a carbon neutral economy where each emitted CO₂ molecule is fast sequestered in plants, algae, soils, sub soils and sediments.
