Want to write 1,000,000 words a year without breaking a sweat? Sounds a little crazy when you say it out loud. However, this is easier to accomplish than you'd think. Especially when using dictation for all your writing. Dictation has the power to transform your life whether you're writing a novel, short story, blog post, or paper. Whatever the outlet, dictation can help you increase your productivity levels. Over the past two years I've switched over to dictation and I went from writing about 250,000 words a year to over a million words. If I really wanted to amp things up I think I could go even higher! The quickest way to success as a new author is to pump out more quality books on a consistent basis. Many indie novelists try and get a full 100k+ book out every 3 - 6 months. Using dictation you'll be able to hit those goals with ease. You could release something new every month if you really felt inspired. So what's the secret to getting all this done? Well, dictation on its own, while wonderful won't write your book for you. You still need to build better writing habits and put in the work. Inside You Will Learn: An Introduction to

Face Recognition for Real Time Application Pradeep Kakkar, 2017-11-27 Master's Thesis from the year 2017 in the subject Engineering - Computer Engineering, grade: 10, , course: M.Tech-ECE,

language: English, abstract: Images containing faces are essential to intelligent vision-based human computer interaction, and research efforts in face processing include face recognition, face tracking, pose estimation, and expression recognition. The rapidly expanding research in face processing is based on the premise that information about a user's identity, state, and intent can be extracted from images and that computers can then react accordingly, e.g., by knowing person's identity, person may be authenticated to utilize a particular service or not. A first step of any face processing system is registering the locations in images where faces are present. The local binary pattern is a simple yet very efficient texture operator which labels the pixels of an image by thresholding the neighborhood of each pixel and considers the result as a binary number. The LBP method can be seen as a unifying approach to the traditionally divergent statistical and structural models of texture analysis. Perhaps the most important property of the LBP operator in real-world applications is its invariance against monotonic gray level changes caused, e.g., by illumination variations. Another equally important is its computational simplicity, which makes it possible to analyze images in challenging real-time settings. The success of LBP in face description is due to the discriminative power and computational simplicity of the LBP operator, and the robustness of LBP to mono-tonic gray scale changes caused by, for example, illumination variations. The use of histograms as features also

makes the LBP approach robust to face misalignment and pose variations. For these reasons, the LBP methodology has already attained an established position in face analysis research. Because finding an efficient spatiotemporal representation for face analysis from videos is challenging, most of the existing works limit the scope of the problem by discarding the facial dynamics and only considering the structure. Motivated by the psychophysical findings which indicate that facial movements can provide valuable information to face analysis, spatiotemporal LBP approaches for face, facial expression and gender recognition from videos were described.
