**Monitoring a Sump Containing Drilling Mud with a High Salt Content** R. D. Nenniger,Fonds renouvelables pour l'étude de l'environnement (Canada),Environmental Studies Revolving Funds (Canada),1987 There is concern that buried sumps containing saltwater drilling fluids in NWT may not remain sufficiently frozen to prevent contamination of surrounding environment, due to freezing point depression by salt and disturbance of permafrost. Study started in September, 1985, to monitor buried salty sump located at Tweed Lake M-47 wellsite. Fixed frequency, electromagnetic (EM) surveys used to locate areas of high conductivity indicating areas of potential salt seepage and thawed sump fluids. Use of EM surveys for detection of salt in permafrost areas had not been documented. 2 potential salt plumes were discovered. Neither extended more than 40 m from sump. In both cases other phenomena might account for high conductivity readings and periodical EM surveys need to be continued.

**SUMP for Cities' Sustainable Development** Marija Burinskienė,Rasa Užpalytė-Vitkūnienė,2021-04-07 In a rapidly changing world, it is necessary to increase the engagement of local authorities and stakeholders to make urban mobility cleaner and more sustainable. The best way is to combine great ideas and innovative measures with political support. This Special Issue consists of six articles analyzing the impact of SUMPs. Innovative measures have been proposed to change urban transport systems towards sustainability: Chinese research has analyzed the tourist flow of Tibet using innovative technologies: mobile phone data, visualizations using GIS, and social networks. Lithuanian authors proposed three autonomous car travel development concepts that should become a conceptual tool in the development of ITS and C-ITS. An English scientific paper is based on a review of local transport policy documents from 13 cities in four countries. Most cities seek to reduce car travel as a proportion of trips. Experience from Slovenia shows that the comprehensive traffic calming approach has positive effects and contributes to achieving sustainable mobility. Korean researchers used the GINI coefficient to evaluate the bus system to identify bus nodes in order of importance. The last article described that multicriteria decision-making methods have been successfully used for assessing the effectiveness of sustainable transport systems, and a universal evaluation model was proposed.

**Yazoo Backwater Pumping Station Sump West-Central Mississippi** ,1990 Numerical and physical hydraulic model tests were conducted to investigated the hydraulic performance of the Yazoo Backwater Pumping Station in West Central Mississippi approach channel, sump abutments, and sump. The numerical model was used as a tool for evaluating and screening various approach channel designs prior to testing in the physical models. Physical model tests were conducted in a 1:12.5-scale section model and a 1:26-scale comprehensive model. A variety of operating conditions with various water-surface evaluations were evaluated. In the section model, tests indicated that the intensity of the floor vortices increased as the suction bell was moved closer to the floor. In the 1:26-scale model, comprehensive tests were initially conducted to investigate hydraulic performance in a 15-pump, 17,5000-cfs-capacity pumping station. Asymmetrical pump operation generated lateral flows in the approach channel, which generated adverse flow distribution in the pump bays. Test indicated that a streamlined pump intake design compensated for adverse flows in the approach. At the request of the US Army Engineer District, Vicksburg, the capacity of the pumping station was reduced from 17,500 to 10,000 cfs. Hydraulic performance with the 10,000-cfs station was similar to that observed in the 17, 5000-cfs station. Tests were conducted to refine the design of the streamlined sump by investigating various pump bay widths. Keywords: Hydraulics, Waterways, Army corps of engineers.
