Mohs Micrographic Surgery Stephen N. Snow, George R. Mikhail, 2004 Mohs Micrographic Surgery, an advanced treatment procedure for skin cancer, offers the highest potential for recovery--even if the skin cancer has been previously treated. This procedure is a state-of-the-art treatment in which the physician serves as surgeon, pathologist, and reconstructive surgeon. It relies on the accuracy of a microscope to trace and ensure removal of skin cancer down to its roots. This procedure allows dermatologists trained in Mohs Surgery to see beyond the visible disease and to precisely identify and remove the entire tumor, leaving healthy tissue unharmed. This procedure is most often used in treating two of the most common forms of skin cancer: basal cell carcinoma and squamous cell carcinoma. The cure rate for Mohs Micrographic Surgery is the highest of all treatments for skin cancer--up to 99 percent even if other forms of treatment have failed. This procedure, the most exact and precise method of tumor removal, minimizes the chance of regrowth and lessens the potential for scarring or disfigurement

Mnemonology James B. Worthen,R. Reed Hunt,2011-02-25 This book bridges the gap between basic memory research and mnemonic applications through a careful analysis of the processes that underlie effective memory aids. The book traces the history of mnemonics, examines popular techniques, and discusses the current relevance of mnemonics to both psychological researchers and those seeking to improve their memory. Using a unique approach (termed mnemonology), the authors seek not necessarily to promote specific mnemonic techniques, but to provide information which will allow one to improve memory by creating their own mnemonics.
