**Wireless Sensor Networks** Fadi Al-Turjman, 2018-01-03 Wireless Sensor Networks overcome the difficulties of other monitoring systems. However, they require further efficiencies for Outdoor Environment Monitoring (OEM) applications due to their harsh operational conditions, huge targeted areas, limited energy budget, and required 3D setups. A fundamental issue in defeating these practical challenges is deployment planning. The deployment plan is a key factor of many intrinsic properties of OEM networks, summarized in connectivity, lifetime, fault-tolerance, and cost-effectiveness. This book investigates the problem of WSNs deployments that address these properties in order to overcome the unique challenges and circumstances in OEM applications.

**Wireless FM Bug** Joshua Anquandah, 2016-01-23 This book is for anybody wanting to make a wireless monitoring or surveillance device. It is very detailed research and knowledge to bless anyone who reads it. It is actually a thesis. The wireless FM bug is a sensitive miniature very high FM wireless microphone transmitter of the type Wide Band Frequency Modulation Wireless Microphone (WBFMWM). Basically, it serves as a detective device to secretly monitor conversation and can be used to detect lies. It can be considered as a surveillance device. This is a hardware project which involves RF (radio frequency) circuit design. What makes the FM bug different from other devices is its wireless property. The FM bug receives

sound waves preferably human voice through the microphone. The sound wave is converted into electrical energy and then back to audio signal at the output end. In view of that, there are three (3) stages (modules) involved in the implementation of the bug. They are the audio amplifier, FM oscillator and the RF buffer amplifier stages. The sound wave received through the microphone is amplified to a level that can be modulated over RF. The electromagnetic wave that is constantly generated at the FM oscillator stage is buffered with adequate power being supplied to be transmitted strongly through the antenna. Finally, the audio signal is output and retrieved from a broadcast radio FM. Purchase this book to find out more. This is a fantastic book on making a monitoring device.

**A Scalable Wireless LAN Monitoring and Auditing Scheme** Shukri Afnan, 2014-12-05 Promiscuous monitoring of Wi-Fi networks has often been a source of confusion. It appears logical that if any Ethernet adapter can be used for promiscuous mode monitoring in a wired Ethernet network, then any Wireless Ethernet adapter is equally good for doing the same in a 802.11 a, b, or g network. Theoretically, this is true, but in practice, this is very far from reality because not all wireless NICs support promiscuous mode. Therefore to solve the problem related to wireless NICs and when all we need to monitor is the traffic between wireless stations and the internet; the proposed network layout by using a standard, non-wireless monitor on a mirror port would make it possible to capture the packets being sent and received through the access point. In addition, a software monitoring system named Effective Wireless Monitoring Tool has been built to help the network administrator to discover network problems as soon as possible. The proposed system achieves its goals by sniffing, capturing, and analyzing the network traffic data packets without affecting or interfering with the network information flow by configuring the network in promiscuous mode.

**Smart Wireless Acoustic Sensor Network Design for Noise Monitoring in Smart Cities** Rosa Ma Alsina-Pagès, Patrizia Bellucci, Giovanni

Zambon,2021-01-15 The Environmental Noise Directive (END) requires that a five-year updating of noise maps is carried out to check and report on the changes that have occurred during the reference period. The updating process is usually achieved using a standardized approach consisting of collecting and processing information through acoustic models to produce the updated noise maps. This procedure is time consuming and costly, and has a significant impact on the financial statement of the authorities responsible for providing the maps. Furthermore, the END requires that easy-to-read noise maps are made available to the public to provide information on noise levels and the subsequent actions to be undertaken by local and central authorities to reduce noise impacts. In order to update the noise maps more easily and in a more effective way, it is convenient to design an integrated system incorporating real-time noise measurement and signal processing to identify and analyze the noise sources present in the mapping area (e.g., road traffic noise, leisure noise, etc.) as well as to automatically generate and present the corresponding noise maps. This wireless acoustic sensor network design requires transversal knowledge, from accurate hardware design for acoustic sensors to network structure design and management of the information with signal processing to identify the origin of the measured noise and graphical user interface application design to present the results to end users. This book is collection in which several views of methodology and technologies required for the development of an efficient wireless acoustic sensor network from the first stages of its design to the tests conducted during deployment, its final performance, and possible subsequent implications for authorities in terms of the definition of policies. Contributions include several LIFE and H2020 projects aimed at the design and implementation of intelligent acoustic sensor networks with a focus on the publication of good practices for the design and deployment of intelligent networks in other locations.

*Contactless Vital Signs Monitoring* Wenjin Wang,Xuyu Wang,2021-09-20 Vital signs, such as heart rate and respiration rate, are useful to health monitoring because they can provide important physiological insights for medical diagnosis and well-being management. Most traditional methods for measuring vital signs require a person to wear biomedical devices, such as a capnometer, a pulse oximeter, or an electrocardiogram sensor. These contact-based technologies are inconvenient, cumbersome, and uncomfortable to use. There is a compelling need for technologies that enable contact-free, easily deployable, and long-term monitoring of vital signs for healthcare. Contactless Vital Signs Monitoring presents a systematic and in-depth review on the principles, methodologies, and opportunities of using different wavelengths of an electromagnetic spectrum to measure vital signs from the human face and body contactlessly. The volume brings together pioneering researchers active in the field to report the latest progress made, in an intensive and structured way. It also presents various healthcare applications using camera and radio frequency-based monitoring, from

clinical care to home care, to sport training and automotive, such as patient/neonatal monitoring in intensive care units, general wards, emergency department triage, MR/CT cardiac and respiratory gating, sleep centers, baby/elderly care, fitness cardio training, driver monitoring in automotive settings, and more. This book will be an important educational source for biomedical researchers, AI healthcare researchers, computer vision researchers, wireless-sensing researchers, doctors/clinicians, physicians/psychologists, and medical equipment manufacturers. Includes various contactless vital signs monitoring techniques, such as optical-based, radar-based, WiFi-based, RFID-based, and acoustic-based methods. Presents a thorough introduction to the measurement principles, methodologies, healthcare applications, hardware set-ups, and systems for contactless measurement of vital signs using camera or RF sensors. Presents the opportunities for the fusion of camera and RF sensors for contactless vital signs monitoring and healthcare.

Invasive Intracranial Pressure Monitor System Fa Wang, 2017 Head trauma, hydrocephalus, intracranial tumors, hepatic encephalopathy, and cerebral edema cause increased intracranial pressure (ICP). Early and timely detection of elevated ICP is very important to mitigate symptoms during the entire life of the patient to avoid headaches, mental disability and death caused by abnormal increased ICP. We present a wide frequency range, low cost, wireless intracranial pressure (ICP) monitoring system, which includes an implantable passive sensor, and an external reader. The passive sensor consists of two spiral coils and transduces the pressure change to a resonant frequency shift. The improved circuit model and design process of this sensor are given. The external portable reader reads out the sensor's resonant frequency over a wide frequency range (35 MHz to 2.7 GHz). We propose a novel circuit topology, which tracks the system's impedance and phase change at a high frequency with low cost components. This circuit is very simple and reliable. A prototype was developed, and measurement results demonstrate that the device achieves a suitable measurement distance (>2 cm), sufficient sample frequency (>6 Hz), fine resolution, and good measurement accuracy for medical practice. Responsivity of this prototype is 0.92 MHz/mmHg and resolution is 0.001.84mmHg. COMSOL Specific absorption rate (SAR) simulation proves this system is safe.
