Early Modern Humans at the Moravian Gate Maria Teschler-Nicola, 2007-07-28 The Upper Paleolithic fossils of the Mladec caves, South Moravia, excavated at the end of the 19th century, hold a key position in the current discussion on modern human emergence within Europe and the fate of the Neanderthals. Although undoubtedly early modern humans - recently radio carbon dated to 31.000 years BP - their morphological variability and the presence of archaic features are indicative to some degree of regional Neanderthal ancestry. The beautifully illustrated monograph addresses - for the first time - the complete assemblage of the finds, including the human cranial, post cranial, teeth and jaw fragments of several individuals (most of them stored at the Natural History Museum Vienna) as well as the faunal remains and the archaeological objects. Leading scientists present their results, obtained with innovative techniques such as DNA analysis, 3D-morphometry and isotope analysis, which are of great importance for further discussions on both human evolution and archaeological issues.

Origin Of Symmetries C D Froggatt, H B Nielsen, 1991-08-13 The development in our understanding of symmetry principles is reviewed. Many symmetries, such as charge conjugation, parity and strangeness, are no longer considered as fundamental but as natural consequences of a gauge field theory of strong and electromagnetic interactions. Other symmetries arise naturally from physical models in some limiting situation, such as for low energy or low mass. Random dynamics and attempts to explain all symmetries — even Lorentz invariance and gauge invariance — without appealing to any fundamental invariance of the laws of nature are discussed. A selection of original papers is reprinted.

Tracking Environmental Change Using Lake Sediments William M. Last, John P.

Smol, 2002-06-30 This first volume in the Developments in Paleoenvironmental Research series deals with the acquisition and archiving of lake sediment cores, chronological techniques, and large-scale basin analysis methods used in paleolimnology. Other volumes deal with physical and geochemical parameters and methods (Volume 2), biological techniques (Volumes 3 and 4), and statistical and data handling methods (Volume 5). These monographs provide sufficient detail and breadth to be useful handbooks for both seasoned practitioners as well as newcomers to the area of paleolimnology. Although the chapters in these volumes target mainly lacustrine settings, many of the techniques described can also be readily applied to fluvial, glacial, marine, estuarine, and peatland environments.

The Presocratics at Herculaneum Christian Vassallo,2021-09-20 This volume analyses in depth the reception of early Greek philosophy in the Epicurean tradition and provides for the first time in scholarship a comprehensive edition, with translation and commentary, of all the Herculanean testimonia to the Presocratics. Among the most significant scientific outcomes, it provides elements for the attribution of an earlier date to the attested tradition of Xenophanes' scepticism; a complete reconstruction of the Epicurean reception of Democritus; a new reconstruction of the testimonia to Nausiphanes' concept of physiologia, Anaxagoras' physics and theology, and Empedocles' epistemology; new texts for better comparing the doxographical sections of Philodemus' *On Piety* with those of Cicero's *On the Nature of the Gods*, which update H. Diels' treatment of this subject in his *Doxographi Graeci*.

World Soul – Anima Mundi Christoph Helmig,2020-01-20 From Plato's *Timaeus* onwards, the world or cosmos has been conceived of as a living, rational organism. Most notably in German Idealism, philosophers still talked of a 'Weltseele' (Schelling) or 'Weltgeist' (Hegel). This volume is the first collection of essays on the origin of the notion of the world soul (*anima mundi*) in Antiquity and beyond. It contains 14 original contributions by specialists in the field of ancient philosophy, the Platonic tradition and the history of theology. The topics range from the 'obscure' Presocratic Heraclitus, to Plato and his ancient readers in Middle and Neoplatonism (including the Stoics), to the reception of the idea of a world soul in the history of natural science. A general introduction highlights the fundamental steps in the development of the Platonic notion throughout late Antiquity and early Christian philosophy. Accessible to Classicists, historians of philosophy, theologians and invaluable to

specialists in ancient philosophy, the book provides an overview of the fascinating discussions surrounding a conception that had a long-lasting effect on the history of Western thought.

Fundamentals of Error-Correcting Codes W. Cary Huffman, Vera Pless, 2010-02-18 *Fundamentals of Error Correcting Codes* is an in-depth introduction to coding theory from both an engineering and mathematical viewpoint. As well as covering classical topics, there is much coverage of techniques which could only be found in specialist journals and book publications. Numerous exercises and examples and an accessible writing style make this a lucid and effective introduction to coding theory for advanced undergraduate and graduate students, researchers and engineers, whether approaching the subject from a mathematical, engineering or computer science background.

Low-Rank Approximation Ivan Markovsky, 2018-08-03 This book is a comprehensive exposition of the theory, algorithms, and applications of structured low-rank approximation. Local optimization methods and effective suboptimal convex relaxations for Toeplitz, Hankel, and Sylvester structured problems are presented. A major part of the text is devoted to application of the theory with a range of applications from systems and control theory to psychometrics being described. Special knowledge of the application fields is not required. The second edition of */Low-Rank Approximation/* is a thoroughly edited and extensively rewritten revision. It contains new chapters and sections that introduce the topics of: • variable projection for structured low-rank approximation; • missing data estimation; • data-driven filtering and control; • stochastic model representation and identification; • identification of polynomial time-invariant systems; and • blind identification with deterministic input model. The book is complemented by a software implementation of the methods presented, which makes the theory directly applicable in practice. In particular, all numerical examples in the book are

included in demonstration files and can be reproduced by the reader. This gives hands-on experience with the theory and methods detailed. In addition, exercises and MATLAB[®] /Octave examples will assist the reader quickly to assimilate the theory on a chapter-by-chapter basis. "Each chapter is completed with a new section of exercises to which complete solutions are provided." Low-Rank Approximation (second edition) is a broad survey of the Low-Rank Approximation theory and applications of its field which will be of direct interest to researchers in system identification, control and systems theory, numerical linear algebra and optimization. The supplementary problems and solutions render it suitable for use in teaching graduate courses in those subjects as well.
