Visibility Algorithms in the Plane Subir Kumar Ghosh,2007-03-29 A human observer can effortlessly identify visible portions of geometric objects present in the environment. However, computations of visible portions of objects from a viewpoint involving thousands of objects is a time consuming task even for high speed computers. To solve such visibility problems, efficient algorithms have been designed. This book presents some of these visibility algorithms in two dimensions. Specifically, basic algorithms for point visibility, weak visibility, shortest paths, visibility graphs, link paths and visibility queries are all discussed. Several geometric properties are also established through lemmas and theorems. With over 300 figures and hundreds of exercises, this book is ideal for graduate students and researchers in the field of computational geometry. It will also be useful as a reference for researchers working in algorithms, robotics, computer graphics and geometric graph theory, and some algorithms from the book can be used in a first course in computational geometry.

Georgette's Apple Bivortex Theory of Everything (A Grand Unified Theory of the Universe) George William Kelly,2001-08-13 George William Kelly wrote this collection of eight childrens stories over the lifetime of his daughter, Georgette. He named the heroines after her. By the time he published the collection, Georgette had reached the age of sweet sixteen. Consequently, some of the stories aim at picture book readers and some at teenage readers. They reflect Georgettes growing older and older. The stories range from how Santa Christina (Mrs. Santa Claus) saved Christmas by helping Santa Claus deliver the Christmas toys, to how Georgette discovered there are 32 tooth pixies instead of one tooth fairy, to how Georgettes family developed the idea of a grand unified theory of the universe from apples in their kitchen fruit bowl. As a gift for Georgettes sixteenth birthday, Kelly combined his eight favorite stories into a print-on-demand paperback book (and an e-book) published by the Xlibris Corp. Like many childrens books, this one offers food for thought to adults as well as to children. It has no illustrations, but the author believes children will draw their own pictures. He hopes that some of the stories may be republished later as individual picture books. Georgettes Apple Bivortex Theory of Everything. This story presents a model that shows how everything in the universe evolves, Kelly says. Modern scientists have searched and searched for this model but have failed to see it. Great scientists like Rene Descartes, Isaac Newton, Michael Faraday, James Clark Maxwell, Max Planck, Albert Einstein, and Niels Bohr circled close around this model, but even those giants failed to see it. Georgettes bivortex theory evolved over sixteen years. Georgette, her Mommy, and her Daddy were seeking one, single answer to a young girls unending questions about everything. Their amateur, commonsense approach led them further and further into the realms of astronomy, cosmology, mathematics, physics, and the history of science. Although they could not speak the various scientific dialects, they could comprehend general scientific speculation about the universe. They could also ponder the detailed pictures of the universe provided by space-age astronomy. Just as a small child saw the real truth in the old fairy tale about the emperors new clothes, so Georgettes scientifically unsophisticated family saw in the apple-like shapes of certain space photographs a new model for a theory of everything: a grand unified theory of the universe. As far as the family knows, this model never occurred to the scientists who have striven to harmonize red shifts, the Big Bang, the expanding universe, black holes, wormholes, gravity, electromagetism, curved space, strings, branes, quantum, matter, antimatter, dark matter, wimps, strong nuclear force, weak nuclear force, Bose-Einstein condensates, great walls, chaos theory, etc. Georgettes bivortex model takes the shape of an apple in the center of a large cloud of particles. It begins when two or more particles eddy around each other and form a tube. This rotating tube of

particles sucks more and more cloud particles down the vortex at each end of the tube. The opposing helical streams of particles collide at the tubes center. The particles split, ricochet, and radiate outward to form an equatorial bulge and equatorial disk. Nearly all these particles are drawn back eventually toward the rotating tube. They rise in arched pathways northward and southward from the equatorial bulge and disk. Some return quickly to the walls of the tube. Others return leisurely via either the north pole vortex or the south pole vortex. The particles recycle along the lines of the bivortex field, just as iron filings follow the lines of a magnets electromagnetic field. At the extreme circumference of the disk, some particles leave the system altogether and radiate into space. Meanwhile, some particles pass the tubes center-point and follow the tubes axis in

Logic for Programming, Artificial Intelligence, and Reasoning Edmund M. Clarke,Andrei Voronkov,2011-01-04 This book constitutes the thoroughly refereed post-conference proceedings of the 16th International Conference on Logic for Programming, Artificial Intelligence, and Reasoning, LPAR 2010, which took place in Dakar, Senegal, in April/May 2010. The 27 revised full papers and 9 revised short papers presented together with 1 invited talk were carefully revised and selected from 47 submissions. The papers address all current issues in automated reasoning, computational logic, programming languages and deal with logic programming, logic-based program manipulation, formal methods, and various kinds of AI logics. Subjects covered range from theoretical aspects to various applications such as automata, linear arithmetic, verification, knowledge representation, proof theory, quantified constraints, as well as modal and temporal logics.

China Satellite Navigation Conference (CSNC) 2017 Proceedings: Volume II Jiadong Sun,Jingnan Liu,Yuanxi Yang,Shiwei Fan,Wenxian Yu,2017-05-02 These proceedings present selected research papers from CSNC2017, held during 23th-25th May in Shanghai, China. The theme of CSNC2017 is Positioning, Connecting All. These papers discuss the technologies and applications of the Global Navigation Satellite System (GNSS), and the latest progress made in the China BeiDou System (BDS) especially. They are divided into 12 topics to match the corresponding sessions in CSNC2017, which broadly covered key topics in GNSS. Readers can learn about the BDS and keep abreast of the latest advances in GNSS techniques and applications.

GPU Computing and Applications Yiyu Cai,Simon See,2014-11-20 This book presents a collection of state of the art research on GPU Computing and Application. The major part of this book is selected from the work presented at the 2013 Symposium on GPU Computing and Applications held in Nanyang Technological University, Singapore (Oct 9, 2013). Three major domains of GPU application are covered in the book including (1) Engineering design and simulation; (2) Biomedical Sciences; and (3) Interactive & Digital Media. The book also addresses the fundamental issues in GPU computing with a focus on big data processing. Researchers and developers in GPU Computing and Applications will benefit from this book. Training professionals and educators can also benefit from this book to learn the possible application of GPU technology in various areas.

Advances in Internet, Data & Web Technologies Leonard Barolli,Fatos Xhafa,Nadeem Javaid,Evjola Spaho,Vladi Kolici,2018-02-23 This book presents original contributions on the theories and practices of emerging Internet, data and Web technologies and their

applicability in businesses, engineering and academia, focusing on advances in the life-cycle exploitation of data generated from the digital ecosystem data technologies that create value, e.g. for businesses, toward a collective intelligence approach. The Internet has become the most proliferative platform for emerging large-scale computing paradigms. Among these, data and web technologies are two of the most prominent paradigms and are found in a variety of forms, such as data centers, cloud computing, mobile cloud, and mobile Web services. These technologies together create a digital ecosystem whose cornerstone is the data cycle, from capturing to processing, analyzing and visualizing. The investigation of various research and development issues in this digital ecosystem are made more pressing by the ever-increasing requirements of real-world applications that are based on storing and processing large amounts of data. The book is a valuable resource for researchers, software developers, practitioners and students interested in the field of data and web technologies.

Ridge Functions and Applications in Neural Networks Vugar E. Ismailov,2021-12-17 Recent years have witnessed a growth of interest in the special functions called ridge functions. These functions appear in various fields and under various guises. They appear in partial differential equations (where they are called plane waves), in computerized tomography, and in statistics. Ridge functions are also the underpinnings of many central models in neural network theory. In this book various approximation theoretic properties of ridge functions are described. This book also describes properties of generalized ridge functions, and their relation to linear superpositions and Kolmogorov's famous superposition theorem. In the final part of the book, a single and two hidden layer neural networks are discussed. The results obtained in this part are based on properties of ordinary and generalized ridge functions. Novel aspects of the universal approximation property of feedforward neural networks are revealed. This book will be of interest to advanced graduate students and researchers working in functional analysis, approximation theory, and the theory of real functions, and will be of particular interest to those wishing to learn more about neural network theory and applications and other areas where ridge functions are used.

Matrix Mathematics Dennis S. Bernstein,2009-07-26 Each chapter in this book describes relevant background theory followed by specialized results. Hundreds of identities, inequalities, and matrix facts are stated clearly with cross references, citations to the literature, and illuminating remarks.

Plates, Laminates and Shells T Lewinski,J J Telega,2000-03-23 This book gives a systematic and comprehensive presentation of the results concerning effective behavior of elastic and plastic plates with periodic or quasiperiodic structure. One of the chapters covers the hitherto available results concerning the averaging problems in the linear and nonlinear shell models. A unified approach to the problems studied is based on modern variational and asymptotic methods, including the methods of variational inequalities as well as homogenization techniques. Duality arguments are also exploited. A significant part of the book deals with problems important for engineering practice, such as: statical analysis of highly nonhomogeneous plates and shells for which common discretization techniques fail to be efficient, assessing stiffness reduction of cracked [00n/900m]s laminates, and assessing ultimate loads for perfectly plastic plates and shells composed of repeated segments. When possible, the homogenization formulas are cast in closed form expressions. The formulas presented in this manner are then used in constructing regularized formulations of the fundamental optimization problems for plates and shells, since the regularization concepts are based on introducing the composite regions for which microstructural properties play the role of new design variables.
