Multiple Sclerosis Institute of Medicine, Board on Neuroscience and Behavioral Health, Committee on Multiple Sclerosis: Current Status and Strategies for the Future, 2001-08-10 Multiple sclerosis is a chronic and often disabling disease of the nervous system, affecting about 1 million people worldwide. Even though it has been known for over a hundred years, no cause or cure has yet been discovered—but now there is hope. New therapies have been shown to slow the disease progress in some patients, and the pace of discoveries about the cellular machinery of the brain and spinal cord has accelerated. This book presents a comprehensive overview of multiple sclerosis today, as researchers seek to understand its processes, develop therapies that will slow or halt the disease and perhaps repair damage, offer relief for specific symptoms, and improve the abilities of MS patients to function in their daily lives. The panel reviews existing knowledge and identifies key research questions, focusing on: Research strategies that have the greatest potential to understand the biological mechanisms of recovery and to translate findings into specific strategies for therapy. How people adapt to MS and the research needed to improve the lives of people with MS. Management of disease symptoms (cognitive impairment, depression, spasticity, vision problems, and others). The committee also discusses ways to build and financially support the MS research enterprise, including a look at challenges inherent in designing clinical trials. This book will be important to MS researchers, research funders, health care advocates for MS research and treatment, and interested patients and their families.

Multiple Sclerosis Dr. T. Jock Murray, MS, 2004-12-01 Multiple Sclerosis: The History of a Disease won a 2005 ForeWord Book of the Year Silver Medal! The basic facts about multiple sclerosis are well known: it is the most common neurologic disease of young adults, usually beginning with episodic attacks of neurologic symptoms, then entering a progressive phase some years later. Its onset has an average age of 30, and occurs in about 1 in 500 individuals of European ancestry living primarily in temperate climates. There appears to be a complex interaction between a genetic predisposition and an environmental trigger that initiates the disease. But these facts do not convey the impact of the disease on the people whose lives it affects. In this elegantly written and comprehensive history, we meet individuals who suffered with MS in the centuries before the disease had a name, including blessed Lidwina of Holland, who took joy from her misery, believing that she was sent to accept suffering for the sins of others; Augustus d'Est, grandson of George III and cousin of Queen Victoria, whose case shows how someone with access to the best of medical care of the age was understood and managed; and Heinrich Heine, the great German poet, who also had access to all medical services that were available, but who progressed into his mattress grave in two decades, aware of the loss of physical ability while still able to compose great poetry to the end. From these early cases the author demonstrates how progress in diagnosing and managing multiple sclerosis has paralleled the development of medical science, from the early developments in modern studies of anatomy and pathology, to the framing of the disease in the nineteenth century, and eventually to modern diagnosis and treatment. From beginning to end, Dr. Murray takes us on a fascinating journey of discovery, in the process showing how the evolution of our understanding of multiple sclerosis has been part of the

greater history of medical knowledge.

Multiple Sclerosis Michael Olek, 2007-10-27 A synthesis of current concepts about the evaluation, treatment, and future directions in MS. On the evaluation side, the authors review the use of MRI, magnetic resonance spectroscopy, functional MRI, and three-dimensional MRI, and consider the rapidly developing body of pathologic information they have yielded. On the treatment side, the focus is on recently approved medications (Novantrone), new indications for medications (CHAMPS Trial), medications in development (Oral Interferon Tau, Oral Copaxone, and Oral Cellcept), immunosuppressive therapy for both progressive disease and symptomatic therapy; the current medications for treating relapsing-remitting MS (Avonex, Betaseron, and Copaxone) are also discussed. For future directions, the authors present the current best thinking, as well as the latest discoveries in immunology relating to MS, including groundbreaking B-cell research and its applications to specific immunotherapies, and the use of immune markers for tracking the disease.
